Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-001839-PIP01-15
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Interim
Date of interim/final analysis	30 April 2018
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 April 2018
Global end of trial reached?	No

Notes:

General information about the trial

Main objective of the trial:

No formal hypothesis testing is planned in the study. All the analyses will be descriptive and be performed for each cohort separately.

The main objectives of the study are to investigate the efficacy, safety, and pharmacokinetics of subcutaneous (SC) emicizumab administered at 1.5 mg/kg QW, 3 mg/kg Q2W, and 6 mg/kg Q4W in pediatric subjects with hemophilia A and factor VIII inhibitors who are currently receiving treatment with bypassing agents.

Protection of trial subjects:

This study will be conducted in full conformance with the ICH E6 guideline for Good Clinical Practice and the principles of the Declaration of Helsinki, or the laws and regulations of the country in which the research is conducted, whichever affords the greater protection to the individual.

An Informed Consent Form and Assent Form must be signed and dated by the pediatric subject's legally authorized representative and the subject (when applicable) before his or her participation in the study.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	22 July 2016
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	6 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 7
Country: Number of subjects enrolled	Costa Rica: 1
Country: Number of subjects enrolled	Spain: 12
Country: Number of subjects enrolled	France: 4
Country: Number of subjects enrolled	Italy: 7
Country: Number of subjects enrolled	Japan: 9
Country: Number of subjects enrolled	South Africa: 6
Country: Number of subjects enrolled	Turkey: 8
Country: Number of subjects enrolled	United Kingdom: 10
Country: Number of subjects enrolled	United States: 24
Worldwide total number of subjects	88
EEA total number of subjects	40

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	8
Children (2-11 years)	77
Adolescents (12-17 years)	3
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Following completion of accrual to Cohort A: Emicizumab QW, enrollment was opened to Cohort B: Emicizumab Q2W and Cohort C: Emicizumab Q4W. Of note, enrollment remained open to Cohort A only for subjects who were <2 years old, and enrollment to Cohorts B and C was limited to subjects who were 2-11 years old.

Pre-assignment

Screening details:

A total of 88 subjects with hemophilia A with FVIII inhibitors who were receiving treatment with bypassing agents were enrolled in the study, 68 in Cohort A: Emicizumab QW, 10 in Cohort B: Emicizumab Q2W, and 10 in Cohort C: Emicizumab Q4W.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Cohort A: Emicizumab QW

Arm description:

Subjects received emicizumab at a loading dose of 3 milligrams per kilogram (mg/kg) once every week (QW) subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 1.5 mg/kg QW SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first.

Arm type	Experimental
Investigational medicinal product name	Emicizumab
Investigational medicinal product code	RO5534262
Other name	Hemlibra; ACE910
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Emicizumab was administered at a loading dose of 3 milligrams per kilogram (mg/kg) once every week (QW) subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 1.5 mg/kg QW SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first. During the 52-week treatment period, individual subjects who experienced suboptimal bleeding control on emicizumab (according to protocol-defined criteria) had the opportunity to have their emicizumab maintenance dose up-titrated to 3 mg/kg QW starting on Week 17.

Arm title	Cohort B: Emicizumab Q2W
------------------	--------------------------

Arm description:

Subjects received emicizumab at a loading dose of 3 mg/kg QW subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 3 mg/kg once every 2 weeks (Q2W) SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first.

Arm type	Experimental
Investigational medicinal product name	Emicizumab
Investigational medicinal product code	RO5534262
Other name	Hemlibra; ACE910
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Emicizumab was administered at a loading dose of 3 mg/kg QW subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 3 mg/kg once every 2 weeks (Q2W) SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first. During the 52-week treatment period, individual subjects who experienced suboptimal bleeding control on emicizumab (according to protocol-defined criteria) had the opportunity to have their emicizumab maintenance dose up-titrated to 3 mg/kg QW starting on Week 17.

Arm title	Cohort C: Emicizumab Q4W
------------------	--------------------------

Arm description:

Subjects received emicizumab at a loading dose of 3 mg/kg QW subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 6 mg/kg once every 4 weeks (Q4W) SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first.

Arm type	Experimental
Investigational medicinal product name	Emicizumab
Investigational medicinal product code	RO5534262
Other name	Hemlibra; ACE910
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Emicizumab was administered at a loading dose of 3 mg/kg QW subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 6 mg/kg once every 4 weeks (Q4W) SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first. During the 52-week treatment period, individual subjects who experienced suboptimal bleeding control on emicizumab (according to protocol-defined criteria) had the opportunity to have their emicizumab maintenance dose up-titrated to 3 mg/kg QW starting on Week 17.

Number of subjects in period 1	Cohort A: Emicizumab QW	Cohort B: Emicizumab Q2W	Cohort C: Emicizumab Q4W

Subject analysis set title	Cohort A NIS Population: Prophylactic/Episodic Bypassing Agent
Subject analysis set type	Sub-group analysis
Subject analysis set description: This group includes historical data from subjects in the non-interventional study (NIS) BH29768 (NCT02476942) who had received prophylactic or episodic treatment with bypassing agents and were followed for a minimum of 24 weeks on the NIS prior to enrollment in Cohort A of this study.	
Subject analysis set title	Cohort A NIS Population: Emicizumab QW
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subjects who had previously received episodic or prophylactic treatment with bypassing agents in NIS BH29768 (NCT02476942) and were enrolled in Cohort A of this study received emicizumab at a loading dose of 3 milligrams per kilogram (mg/kg) once every week (QW) subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 1.5 mg/kg QW SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first.	

Primary: Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Bleeds in Treated Subjects <12 Years of Age

End point title	Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Bleeds in Treated Subjects <12 Years of Age ^{[1][2]}
End point description: The number of treated bleeds over the efficacy period is presented as a model-based ABR that was analyzed using a negative binomial regression model with efficacy period as an offset to account for the difference in follow-up times. A bleed is considered a "treated bleed" if it is directly followed (i.e., no intervening bleed) by a hemophilia medication reported to be a "treatment for bleed", irrespective of time between treatment and the preceding bleed. A bleed and the first treatment thereafter and before a new bleed starts, are considered to be pairs, with the following exception: if multiple bleeds occur on the same calendar day, the subsequent treatment is considered to apply for each of these multiple bleeds. The 72-hour rule was implemented: two bleeds of the same type and at the same anatomical location are counted as one bleed if the second bleed occurs within 72 hours from the last treatment for the first bleed. Bleeds due to surgery/procedure are excluded.	
End point type	Primary
End point timeframe: From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy period in Cohort A was 57.57 (17.9-92.6) weeks.	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal hypothesis testing was planned for this study. All statistical analyses are descriptive.

[2] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is a non-randomized study that began by recruiting subjects only to Cohort A: Emicizumab QW; Cohorts B and C were added later in protocol version 4. Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. All available data from Cohorts B and C (efficacy period of about 6 months) were also to be analyzed and are reported as secondary end points.

End point values	Cohort A: Emicizumab QW			
Subject group type	Reporting group			
Number of subjects analysed	65 ^[3]			
Units: treated bleed rate per year				
number (confidence interval 95%)	0.3 (0.17 to 0.50)			

Notes:

[3] - Analysis includes all treated subjects <12 years of age who were on same dose for at least 12 weeks.

Statistical analyses

No statistical analyses for this end point

Primary: Cohort A: Model-Based Annualized Bleeding Rate (ABR) for All Bleeds in Treated Subjects <12 Years of Age

End point title	Cohort A: Model-Based Annualized Bleeding Rate (ABR) for All Bleeds in Treated Subjects <12 Years of Age ^[4] ^[5]
-----------------	--

End point description:

The number of all bleeds over the efficacy period is presented as a model-based ABR that was analyzed using a negative binomial regression model with efficacy period as an offset to account for the difference in follow-up times (i.e., the time that each subject stays in the study). In this outcome measure, all bleeds are included, irrespective of treatment with coagulation factors, with the following exception: bleeds due to surgery/procedure are excluded. As "all bleeds" comprises both treated and non-treated bleeds, the 72-hour rule was implemented separately for treated and non-treated bleeds. For treated bleeds, the 72-hour rule was implemented exactly as defined for the "treated bleeds" outcome measure. For non-treated bleeds, the 72-hour rule was implemented by calculating a treatment-free period of 72 hours from the bleed itself.

End point type	Primary
----------------	---------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy period in Cohort A was 57.57 (17.9-92.6) weeks.

Notes:

[4] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal hypothesis testing was planned for this study. All statistical analyses are descriptive.

[5] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is a non-randomized study that began by recruiting subjects only to Cohort A: Emicizumab QW; Cohorts B and C were added later in protocol version 4. Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. All available data from Cohorts B and C (efficacy period of about 6 months) were also to be analyzed and are reported as secondary end points.

Subject group type	Reporting group			
Number of subjects analysed	65 ^[6]			
Units: all bleed rate per year				
number (confidence interval 95%)	3.2 (1.94 to 5.22)			

Notes:

[6] - Analysis includes all treated subjects <12 years of age who were on same dose for at least 12 weeks.

Statistical analyses

No statistical analyses for this end point

Primary: Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Spontaneous Bleeds in Treated Subjects <12 Years of Age

End point title	Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Spontaneous Bleeds in Treated Subjects <12 Years of Age ^[7] [8]
-----------------	---

End point description:

The number of treated spontaneous bleeds over the efficacy period is presented as a model-based ABR that was analyzed using a negative binomial regression model with efficacy period as an offset to account for the difference in follow-up times (i.e., the time that each subject stays in the study). A bleed is classified as "spontaneous" if there is no other known contributing factor such as trauma or procedure/surgery. A "treated spontaneous bleed" is a spontaneous bleed that also fulfills the conditions of a treated bleed (see ABR for Treated Bleeds for the definition). Treated bleeds that fulfilled the 72-hour rule were included in the analysis of spontaneous bleeds. Bleeds due to surgery/procedure are excluded.

End point type	Primary
----------------	---------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy period in Cohort A was 57.57 (17.9-92.6) weeks.

Notes:

[7] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal hypothesis testing was planned for this study. All statistical analyses are descriptive.

[8] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is a non-randomized study that began by recruiting subjects only to Cohort A: Emicizumab QW; Cohorts B and C were added later in protocol version 4. Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. All available data from Cohorts B and C (efficacy period of about 6 months) were also to be analyzed and are reported as secondary end points.

End point values	Cohort A: Emicizumab QW			
Subject group type	Reporting group			
Number of subjects analysed	65 ^[9]			
Units: treated spontaneous bleed rate per year				
number (confidence interval 95%)	0.0 (0.0 to 0.1)			

Notes:

[9] - Analysis includes all treated subjects <12 years of age who were on same dose for at least 12 weeks.

No statistical analyses for this end point

Primary: Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Joint Bleeds in Treated Subjects <12 Years of Age

End point title	Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Joint Bleeds in Treated Subjects <12 Years of Age ^{[10][11]}
-----------------	--

End point description:

The number of treated joint bleeds over the efficacy period is presented as a model-based ABR that was analyzed using a negative binomial regression model with efficacy period as an offset to account for the difference in follow-up times (i.e., the time that each subject stays in the study). A "joint bleed" is defined as a bleed with type reported as "joint" and with at least one of the following symptoms: increasing swelling or warmth of the skin over the joint and/or increasing pain, decreased range of motion, or difficulty using the joint compared with baseline. A "treated joint bleed" is a joint bleed that also fulfills the conditions of a treated bleed (see ABR for Treated Bleeds for the definition). Only treated bleeds that fulfilled the 72-hour rule were included in the analysis of treated joint bleeds, excluding bleeds due to surgery/procedure.

End point type	Primary
----------------	---------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy period in Cohort A was 57.57 (17.9-92.6) weeks.

Notes:

[10] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal hypothesis testing was planned for this study. All statistical analyses are descriptive.

[11] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is a non-randomized study that began by recruiting subjects only to Cohort A: Efficizumab QW; Cohorts B and C were added later in protocol version 4. Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. All available data from Cohorts B and C (efficacy period of about 6 months) were also to be analyzed and are reported as secondary end points.

End point values	Cohort A: Efficizumab QW			
Subject group type	Reporting group			
Number of subjects analysed	65 ^[12]			
Units: treated joint bleed rate per year				
number (confidence interval 95%)	0.2 (0.08 to 0.29)

Statistical analyses

No statistical analyses for this end point

Primary: Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Target Joint Bleeds in Treated Subjects <12 Years of Age

End point title	Cohort A: Model-Based Annualized Bleeding Rate (ABR) for Treated Target Joint Bleeds in Treated Subjects <12 Years of Age ^{[13][14]}
-----------------	---

End point description:

The number of treated target joint bleeds over the efficacy period is presented as a model-based ABR

that was analyzed using a negative binomial regression model with efficacy period as an offset to account for the difference in follow-up times (i.e., the time that each subject stays in the study). A "target joint bleed" is defined as a joint bleed in a target joint, which is a joint location where at least 3 bleeds have occurred over the last 24 weeks prior to study entry. A "treated target joint bleed" is a target joint bleed that also fulfills the conditions of a treated bleed (see ABR for Treated Bleeds for the definition). Bleeds due to surgery/procedure are excluded. The number '99999' signifies that the model-based ABR and 95% CI were not estimable because too few events had occurred over the efficacy period to calculate values using the negative binomial regression model; 95.4% of subjects in this cohort had 0 treated target joint bleeds.

End point type	Primary
----------------	---------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy period in Cohort A was 57.57 (17.9-92.6) weeks.

Notes:

[13] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal hypothesis testing was planned for this study. All statistical analyses are descriptive.

[14] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Statistical analyses

No statistical analyses for this end point

Primary: Cohort A: Calculated Annualized Bleeding Rate (ABR) for Treated Bleeds in Treated Subjects <12 Years of Age

End point title	Cohort A: Calculated Annualized Bleeding Rate (ABR) for Treated Bleeds in Treated Subjects <12 Years of Age ^{[16][17]}
-----------------	---

End point description:

The number of treated bleeds over the efficacy period is presented here as a calculated ABR that was annualized for each subject using the following formula: $ABR = (\text{number of bleeds} / \text{number of days during the efficacy period}) \times 365.25$. A bleed is considered a "treated bleed" if it is directly followed (i.e., no intervening bleed) by a hemophilia medication reported to be a "treatment for bleed", irrespective of time between treatment and the preceding bleed. A bleed and the first treatment thereafter and before a new bleed starts, are considered to be pairs, with the following exception: if multiple bleeds occur on the same calendar day, the subsequent treatment is considered to apply for each of these multiple bleeds. The 72-hour rule was implemented: two bleeds of the same type and at the same anatomical location are counted as one bleed if the second bleed occurs within 72 hours from the last treatment for the first bleed. Bleeds due to surgery/procedure are excluded.

End point type	Primary
----------------	---------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy period in Cohort A was 57.57 (17.9-92.6) weeks.

Notes:

[16] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal hypothesis testing was planned for this study. All statistical analyses are descriptive.

[17] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is a non-randomized study that began by recruiting subjects only to Cohort A: Emicizumab QW; Cohorts B and C were added later in protocol version 4. Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. All available data from Cohorts B and C (efficacy period of about 6 months) were also to be analyzed and are reported as secondary end points.

End point values	Cohort A: Emicizumab QW			
Subject group type	Reporting group			
Number of subjects analysed	65 ^[18]			
Units: treated bleed rate per year				
median (inter-quartile range (Q1-Q3))	0.0 (0.00 to 0.00)			

Notes:

[18] - Analysis includes all treated subjects <12 years of age who were on same dose for at least 12 weeks.

Statistical analyses

Primary: Cohort A: Calculated Annualized Bleeding Rate (ABR) for All Bleeds in Treated Subjects <12 Years of Age

End point title	Cohort A: Calculated Annualized Bleeding Rate (ABR) for All Bleeds in Treated Subjects <12 Years of Age ^{[19][20]}
-----------------	---

End point description:

The number of all bleeds over the efficacy period is presented here as a calculated ABR that was annualized for each subject using the following formula: $ABR = (\text{number of bleeds/number of days during the efficacy period}) \times 365.25$. In this outcome measure, all bleeds are included, irrespective of treatment with coagulation factors, with the following exception: bleeds due to surgery/procedure are excluded. As "all bleeds" comprises both treated and non-treated bleeds, the 72-hour rule was implemented separately for treated and non-treated bleeds. For treated bleeds, the 72-hour rule was implemented exactly as defined for the "treated bleeds" outcome measure. For non-treated bleeds, the 72-hour rule was implemented by calculating a treatment-free period of 72 hours from the bleed itself.

End point type	Primary
----------------	---------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy period in Cohort A was 57.57 (17.9-92.6) weeks.

Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. Results for Cohort A are reported as primary end points, while corresponding results for Cohorts B and C are reported as secondary end points.

End point values	Cohort B: Efficizumab Q2W	Cohort C: Efficizumab Q4W		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	10 ^[50]	10 ^[51]		
Units: all bleed rate per year				
number (confidence interval 95%)	1.5 (0.62 to 3.40)	3.8 (1.42 to 10.11)		

Notes:

[50] - Analysis includes all treated subjects <12 years of age who were on same dose for at least 12 weeks.

[51] - Analysis includes all treated subjects <12 years of age who were on same dose for at least 12 weeks.

Statistical analyses

No statistical analyses for this end point

Secondary: Cohorts B and C: Model-Based Annualized Bleeding Rate (ABR) for

Treated Spontaneous Bleeds in Treated Subjects <12 Years of Age

End point title	Cohorts B and C: Model-Based Annualized Bleeding Rate (ABR) for Treated Spontaneous Bleeds in Treated Subjects <12 Years of Age ^[52]
-----------------	---

End point description:

The number of treated spontaneous bleeds over the efficacy period is presented as a model-based ABR that was analyzed using a negative binomial (NB) regression model with efficacy period as an offset to account for the difference in follow-up times (i.e., time that each subject stays on-study). A bleed is classified as "spontaneous" if there is no other known contributing factor such as trauma or procedure/surgery. A "treated spontaneous bleed" is a spontaneous bleed that also fulfills the conditions of a treated bleed (see ABR for Treated Bleeds for the definition). Treated bleeds that fulfilled the 72-hour rule were included in the analysis of spontaneous bleeds. Bleeds due to surgery/procedure are excluded. The number '99999' signifies that model-based ABR and 95% CI were not estimable because too few events had occurred over the efficacy period to calculate values using the NB regression model; 100% of subjects in Cohort B had 0 treated spontaneous bleeds.

End point type	Secondary
----------------	-----------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy periods in Cohorts B and C were 21.29 (18.6-24.1) weeks and 19.86 (8.9-24.1) weeks, respectively.

Notes:

[52] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is a non-randomized study that began by recruiting subjects only to Cohort A: Emicizumab QW; Cohorts B and C were added later in protocol version 4. Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. Results for Cohort A are reported as primary end points, while corresponding results for Cohorts B and C are reported as secondary end points.

End point title	Cohorts B and C: Calculated Annualized Bleeding Rate (ABR) for Treated Bleeds in Treated Subjects <12 Years of Age ^[61]
-----------------	--

End point description:

The number of treated bleeds over the efficacy period is presented here as a calculated ABR that was annualized for each subject using the following formula: $ABR = (\text{number of bleeds} / \text{number of days during the efficacy period}) \times 365.25$. A bleed is considered a "treated bleed" if it is directly followed (i.e., no intervening bleed) by a hemophilia medication reported to be a "treatment for bleed", irrespective of time between treatment and the preceding bleed. A bleed and the first treatment thereafter and before a new bleed starts, are considered to be pairs, with the following exception: if multiple bleeds occur on the same calendar day, the subsequent treatment is considered to apply for each of these multiple bleeds. The 72-hour rule was implemented: two bleeds of the same type and at the same anatomical location are counted as one bleed if the second bleed occurs within 72 hours from the last treatment for the first bleed. Bleeds due to surgery/procedure are excluded.

End point type	Secondary

Secondary: Cohorts B and C: Percentage of Subjects by Categorized Number of Treated Joint Bleeds Over the Efficacy Period in Treated Subjects <12 Years of Age

End point title	Cohorts B and C: Percentage of Subjects by Categorized Number of Treated Joint Bleeds Over the Efficacy Period in Treated Subjects <12 Years of Age ^[85]
-----------------	---

End point description:

The percentage of subjects by categorized number of treated joint bleeds over the efficacy period is presented here. A "joint bleed" is defined as a bleed with type reported as "joint" and with at least one of the following symptoms: increasing swelling or warmth of the skin over the joint and/or increasing pain, decreased range of motion, or difficulty using the joint compared with baseline. A "treated joint bleed" is a joint bleed that also fulfills the conditions of a treated bleed (see ABR for Treated Bleeds for the definition). Only treated bleeds that fulfilled the 72-hour rule were included in the analysis of treated joint bleeds, excluding bleeds due to surgery/procedure.

End point type	Secondary
----------------	-----------

End point timeframe:

From Baseline to 52 weeks; At the primary completion date, the median (min-max) duration of the efficacy periods in Cohorts B and C were 21.29 (18.6-24.1) weeks and 19.86 (8.9-24.1) weeks, respectively.

Notes:

[85] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is a non-randomized study that began by recruiting subjects only to Cohort A: Emicizumab QW; Cohorts B and C were added later in protocol version 4. Per protocol, primary analysis for all cohorts was to be performed 52 weeks after all subjects in the primary population of Cohort A had been enrolled or withdrawn prematurely, whichever occurred first. Results for Cohort A are reported as primary end points, while corresponding results for Cohorts B and C are reported as secondary end points.

Secondary: Number of All Bleeds Over Time in Subjects with Dose Up-Titration

End point title	Number of All Bleeds Over Time in Subjects with Dose Up-Titration
End point description:	
The number of all bleeds over time was to be analyzed in subjects whose emicizumab maintenance dose was up-titrated to 3 mg/kg QW if they had experienced suboptimal bleeding control on emicizumab at steady-state, per protocol criteria. In this outcome measure, all bleeds are included, irrespective of treatment with coagulation factors, with the following exception: bleeds due to surgery/procedure are excluded. As "all bleeds" comprises both treated and non-treated bleeds, the 72-hour rule was implemented separately for treated and non-treated bleeds. For treated bleeds, the 72-hour rule was implemented exactly as defined for the "treated bleeds" outcome measure. For non-treated bleeds, the 72-hour rule was implemented by calculating a treatment-free period of 72 hours from the bleed itself. Due to the small sample size at the primary completion date, data could not be analyzed on a population level. Data collection is ongoing, and results will be reported upon study completion.

Secondary: Change from Baseline Over Time in the Hemophilia-Specific Quality of Life Short Form (Haemo-QoL-SF) Questionnaire Total Score, as Completed by Treated Subjects ≥8 to <12 Years of Age

End point title	Change from Baseline Over Time in the Hemophilia-Specific Quality of Life Short Form (Haemo-QoL-SF) Questionnaire Total Score, as Completed by Treated Subjects ≥8 to <12 Years of Age
-----------------	--

End point description:

The Haemo-QoL-SF is a self-reported questionnaire for children ≥8 years of age. It contains 35 items, which cover nine domains considered relevant for the children's health-related quality of life: Physical Health, Feelings, View of Yourself, Family, Friends, Other People, Sports and School, Dealing with

Hemophilia, and Treatment. Items are rated with five respective response options: never, seldom, sometimes, often, and always. The Total Score is derived from the scores for all domains and ranges from 0 to 100, with a lower score reflective of better health-related quality of life. The number '99999' signifies that a 95% confidence interval could not be calculated for data from a single subject. The number '999999' signifies that no data was available at a given timepoint.

Secondary: Change from Baseline Over Time in the Caregiver-Reported Adapted Health-Related Quality of Life for Hemophilia Patients with Inhibitors Including Aspects of Caregiver Burden (Adapted Inhib-QoL) Questionnaire Total Score, Treated Subjects <12 Years of Age

End point title	Change from Baseline Over Time in the Caregiver-Reported Adapted Health-Related Quality of Life for Hemophilia Patients with Inhibitors Including Aspects of Caregiver Burden (Adapted Inhib-QoL) Questionnaire Total Score, Treated Subjects <12 Years of Age
-----------------	--

End point description:

Proxy assessment of health-related quality of life (HRQoL) and aspects of caregiver burden were assessed using the Adapted Inhib-QoL questionnaire, which comprises two parts with a total of 30 questions. The first part asks the caregiver for his/her opinion on the child's HRQoL and consists of two scales: Physical Health and Treatment. The second part asks the caregiver to rate the impact of the child's disease and treatment on them and consists of 6 scales (5 if the child does not have siblings): General Condition, Dealing with the Inhibitor, Perceive Treatment, Family life, Siblings, Contact with Others. Items are rated with five respective response options: never, seldom, sometimes, often, and all the time. The Total Score is derived from the individual scores of all of the domains and it ranges from 0 to 100, with lower scores reflective of better HRQoL. '99999' means 95% CI not calculated for data from 1 subject; '999999' means no data available at that timepoint.

Statistical analyses

No statistical analyses for this end point

Secondary: Plasma Trough Concentration (C_{trough}) of Emicizumab

End point title	Plasma Trough Concentration (C _{trough}) of Emicizumab
-----------------	--

End point description:

Pre-dose (trough) plasma concentrations of emicizumab were analyzed using a validated enzyme-linked immunosorbent assay (ELISA). The lower limit of quantitation was 0.1 micrograms per milliliter ($\mu\text{g/mL}$).

End point type	Secondary
----------------	-----------

End point timeframe:

Predose (0 hour) at Weeks 1, 2, 3, 4, 5, 7, 9, 13, 17, 21, 25, 29, 33, 37, 41, 49, and 57; then every 12 weeks until end of study or 24 weeks after treatment discontinuation (up to approximately 152 weeks)

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From Baseline until the primary completion date (30-Apr-2018); at that time, the median (min-max) duration of observation in Cohorts A, B, and C were 57.36 (17.9-92.6) weeks, 21.29 (18.6-24.1) weeks, and 20.71 (18.0-24.1) weeks, respectively.

Reporting groups

Reporting group title	Cohort A: Emicizumab QW
-----------------------	-------------------------

Reporting group description:

Subjects received emicizumab at a loading dose of 3 milligrams per kilogram (mg/kg) once every week (QW) subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 1.5 mg/kg QW SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first.

Reporting group title	Cohort C: Emicizumab Q4W
-----------------------	--------------------------

Reporting group description:

Subjects received emicizumab at a loading dose of 3 mg/kg QW subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 6 mg/kg once every 4 weeks (Q4W) SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first.

Reporting group title	Cohort B: Emicizumab Q2W
-----------------------	--------------------------

Reporting group description:

Subjects received emicizumab at a loading dose of 3 mg/kg QW subcutaneously (SC) for the first 4 weeks followed by a maintenance dose of 3 mg/kg once every 2 weeks (Q2W) SC for a minimum of 52 weeks, or until unacceptable toxicity, discontinuation from the study due to any cause, or other criteria set forth in the protocol, whichever occurs first.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
12 July 2016	<p>The key changes in Protocol Amendment 1 (Version 2) that modified the study design or analyses, along with a rationale for each change, are summarized as follows: - Due to the anticipated rapid enrollment of the study, recruitment was placed on a temporary halt after the first 20 subjects had enrolled until the Joint Monitoring Committee (JMC) released recommendations on the appropriateness of the maintenance dose; -Modified dose up-titration criteria to more precisely define the subpopulation who may stand to benefit from an increased dose of emicizumab; -Added additional efficacy objectives and endpoints to evaluate all bleeds (i.e., both treated and not treated with coagulation factors) given that some subjects may report bleeds that they did not treat, as well as spontaneous bleeds as additional assessments of efficacy; -Based on feasibility and desire to expand the safety database, the Sponsor increased the maximum number of pediatric subjects with hemophilia A with inhibitors who were previously treated with episodic or prophylactic bypassing agents from 40 to approximately 60. Additionally, if no subjects <2 years are included in the primary cohort (QW Arm), the primary analysis would still occur at the specified time. However, enrollment in the study may be left open exclusively for subjects <2 years in order to enroll up to 5 such subjects.; Removed activated partial thromboplastin time (aPTT) point-of-care testing using the CoaguChek Pro II in order to reduce burden on subjects and sites given the sizeable schedule of assessments; Provided the option for subjects to potentially combine emicizumab volumes (if necessary) from more than 1 vial into 1 syringe to reduce the number of subcutaneous injections they may require.</p>
08 December 2016	<p>The key changes in Protocol Amendment 2 (Version 3) that modified the study design or analyses, along with a rationale for each change, are summarized as follows: -Most recent information on safety findings of thromboembolic events and thrombotic microangiopathy (TMA) events observed in Study BH29884 was added, including requirements for laboratory monitoring of coagulation status following bypassing agent use; -TMA was newly classified as an adverse event of special interest, and an exclusion criterion to exclude patients at high risk to experience TMA (e.g., have a previous medical or family history of TMA) was added; -The permitted and prohibited treatment for control and prevention of bleeds was specified with guidance for use of bypassing agents in combination with emicizumab; -Additional efficacy objectives and endpoints to evaluate treated joint bleeds and treated target joint bleeds were added to the analyses.</p>
01 September 2017	<p>The key changes in Protocol Amendment 3 (Version 4) that modified the study design or analyses, along with a rationale for each change, are summarized as follows: -Two arms (designated as the Q2W Arm and Q4W Arm; subjects 2 to 11 years of age) were added to the study to investigate additional, less frequent emicizumab dosing schedules (Q2W and Q4W).; -Approximately 80 subjects were planned to be included in the study, with 60 subjects in the QW Arm and 20 subjects in the additional Q2W and Q4W arms (10 subjects each).; -The up-titration schema was modified with removal of the 2.25 mg/kg QW dosing level. This was based on an interim data review, and JMC recommendation characterizing exposure at 1.5 mg/kg QW in subjects 2 to 12 years of age to be similar to adolescent/adult patients. As such, the up-titration dose was the same used in adolescent/adult subjects (3 mg/kg QW). The efficacy endpoint was revised to characterize the efficacy of up-titration on an intra-subject level based on the basis of the number of bleeds over time. This was due to the small number of subjects that were up-titrated.; -A new safety risk associated with emicizumab was added as follows: Life-threatening bleeding due to unreliable standard coagulation tests and inhibitors assays in the setting of emicizumab. Coagulation laboratory tests (including, but not limited to, aPTT, one-stage factor VIII (FVIII) activity, and FVIII inhibitor measurement by Bethesda assay) are not reliable and are impacted by the presence of emicizumab and, therefore, did not reflect patients' underlying hemostatic status accurately.</p>

Notes:

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
28 October 2016	The initial emicizumab maintenance dose of 1.5 mg/kg QW was evaluated by the Study BH29992 Joint Monitoring Committee (JMC) during an interim data review. At that time, further enrollment in the study was on the prespecified, protocol-defined hold, pending JMC interim data review and recommendations. All available data (including safety, efficacy, and pharmacokinetics) from the first 20 subjects enrolled in Cohort A was assessed by the JMC to determine the appropriateness of the starting maintenance dose, as well as to decide whether the study could begin enrolling subjects <2 years of age. On 7 December 2016, the JMC recommended continuing enrollment of subjects in Cohort A at the maintenance dose of 1.5 mg/kg QW, as well as to open enrollment to subjects <2 years of age at that same maintenance dose.	07 December 2016
