

Clinical trial results: Vorapaxar in the human endotoxemia model Summary

EudraCT number	2016-000309-34
Trial protocol	AT
Global end of trial date	30 November 2016

Results information

Result version number	v2 (current)
This version publication date	03 September 2019
First version publication date	04 January 2019
Version creation reason	<ul style="list-style-type: none">• Correction of full data set We have falsely described the statistical testing as testing for "equivalence", while it was done for "superiority". This will be corrected.

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 November 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 November 2016
Global end of trial reached?	Yes
Global end of trial date	30 November 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To investigate whether vorapaxar reduces LPS induced coagulation activation assessed by prothrombin fragments F1+2

Protection of trial subjects:

"Willingness to comply with the trial's safety demands (to refrain from excessive sporting activities two weeks after Vorapaxar intake, i.e. full contact sports, climbing, mountain biking etc.)" was an inclusion criterion, which was applied to reduce the risk of bleeding.

Paracetamol was available to all subjects to alleviate flu-like symptoms associated with LPS-infusion.

The vorapaxar dose was titrated to a certain effect (based on whole blood aggregometry) to reduce the necessary dose.

Background therapy:

not applicable- healthy volunteers.

Evidence for comparator:

A placebo tablet was used as a comparator in this trial involving healthy volunteers. Since this was a model, no active treatment was necessary.

Actual start date of recruitment	01 June 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Austria: 16
Worldwide total number of subjects	16
EEA total number of subjects	16

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	16
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

16 healthy volunteers were included in this trial between July 25th 2016 and November 30th 2016. This was a single center study which was performed at the Medical University of Vienna, Austria.

Pre-assignment

Screening details:

Sixteen healthy volunteers were screened, which were all successfully included in the trial according to the applicable in- and exclusion criteria.

Period 1

Period 1 title	Main Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer

Blinding implementation details:

Placebos and Verum tablets were not distinguishable from each other by their physicochemical properties. An unblinded study nurse under supervision of an unblinded physician who had access to treatment allocation codes prepared study drugs. They were not otherwise involved in conducting the trial.

Arms

Are arms mutually exclusive?	No
Arm title	Vorapaxar

Arm description:

Verum arm

Arm type	Experimental
Investigational medicinal product name	Vorapaxar
Investigational medicinal product code	
Other name	Zontivity
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

10mg per os were administered on day 1. On day 2 platelet aggregation (TRAP-induced) was measured and according to the results (80% inhibition compared to baseline were the target) additional 10mg vorapaxar could be added to the initial dose. This was necessary in 2 subjects, in whom platelet inhibition did not achieve the defined criteria.

Arm title	Placebo
------------------	---------

Arm description:

Subjects received a placebo tablet as a control during experimental endotoxemia

Arm type	Placebo
Investigational medicinal product name	Placebo tablet
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Healthy volunteers received placebo tablets on day 1. If platelet aggregation did not achieve the predefined target (80% inhibition in TRAP induced whole blood aggregometry), another dose was given to subjects on day 2. This was necessary in all 16 subjects.

Baseline characteristics

Reporting groups

Reporting group title	Main Trial
-----------------------	------------

Reporting group description:

16 healthy volunteers were included in this trial. This was designed as a crossover trial meaning that each subject completed both study periods. One subject did not participate in the second study period due to unforeseen unavailability. Thus only 15 subjects were included in the final analysis.

Reporting group values	Main Trial	Total	
Number of subjects	16	16	
Age categorical			
Units: Subjects			
In utero	0	0	
Preterm newborn infants (gestational age < 37 wks)	0	0	
Newborns (0-27 days)	0	0	
Infants and toddlers (28 days-23 months)	0	0

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

short treatment with vorapaxar, very high variability in PF4 levels (sample handling?), timing of vorapaxar dosing (before LPS infusion)
--
