## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 May 2018
Is this the analysis of the primary completion data?	Yes
Primary completion date	16 February 2018
Global end of trial reached?	Yes
Global end of trial date	31 May 2018
Was the trial ended prematurely?	No
Notes:	

## General information about the trial

Main objective of the trial:

The primary objective of this study was to evaluate the safety and tolerability of selonsertib (GS-4997) in combination with prednisolone versus prednisolone alone in participants with severe alcoholic hepatitis (AH).

Protection of trial subjects:

The protocol and consent/assent forms were submitted by each investigator to a duly constituted Independent Ethics Committee (IEC) or Institutional Review Board (IRB) for review and approval before study initiation. All revisions to the consent/assent forms (if applicable) after initial IEC/IRB approval were submitted by the investigator to the IEC/IRB for review and approval before implementation in accordance with regulatory requirements. This study was conducted in accordance with recognized international scientific and ethical standards, including but not limited to the International Conference on Harmonization guideline for Good Clinical Practice (ICH GCP) and the original principles embodied in the Declaration of Helsinki.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 September 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	United States: 33
Country: Number of subjects enrolled	France: 20
Country: Number of subjects enrolled	Belgium: 11
Country: Number of subjects enrolled	Austria: 7
Country: Number of subjects enrolled	Canada: 4
Country: Number of subjects enrolled	Switzerland: 1
Country: Number of subjects enrolled	United Kingdom: 28
Worldwide total number of subjects	104
EEA total number of subjects	66

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	100
From 65 to 84 years	4
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

Participants were enrolled at study sites in Europe and North America. The first participant was screened on 01 September 2016. The last study visit occurred on 31 May 2018. Two participants were randomized in the Selonsertib + Prednisolone arm but were never treated.

### Pre-assignment

Screening details:

166 participants were screened.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Selonsertib + Prednisolone

Arm description:

Participants received selonsertib + prednisolone for 28 days.

Arm type	Experimental
Investigational medicinal product name	Selonsertib
Investigational medicinal product code	
Other name	GS-4997
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

18 mg administered for 28 days, without regard to food.

Investigational medicinal product name	Prednisolone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

40 mg (4 X 10 mg tablets) administered once daily for 28 days, without regard to food.

<b>Arm title</b>	Placebo + Prednisolone
------------------	------------------------

Arm description:

Participants received placebo-to-match selonsertib + prednisolone for 28 days.

Arm type	Placebo
Investigational medicinal product name	Prednisolone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

40 mg (4 X 10 mg tablets) administered orally once daily for 28 days, without regard to food.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo-to-match selonsertib tablets administered once daily for 28 days, without regard to food.

<b>Number of subjects in period 1<sup>[1]</sup></b>	Selonsertib + Prednisolone	Placebo + Prednisolone
Started	50	52
Completed	26	37
Not completed	24	15
Adverse event, non-fatal	1	2
Protocol violation	-	1
Death	12	8
Liver biopsy inconsistent with diagnosis	2	-
Withdrew consent	3	2
Investigator's discretion	2	-
Lost to follow-up	4	2

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Two participants were randomized in Selonsertib + Prednisolone arm but were never treated.

## Baseline characteristics

Units: Grams per deciliter (g/dL)			
arithmetic mean	3.1	3.0	
standard deviation	± 0.62	± 0.53	-
International Normalized Ratio (INR)			
# of Participants Analyzed: Selonsertib + Prednisolone = 47; Placebo + Prednisolone = 52			
Units: Ratio			
arithmetic mean	1.7	1.6	
standard deviation	± 0.31	± 0.22	-
Model for End- Stage Liver Disease (MELD) Score			
MELD scores are used to assess prognosis and suitability for liver transplantation. Scores can range from 6 to 40, with higher scores indicating greater disease severity.			
Units: Units on a scale			
arithmetic mean	22	22	
standard deviation	± 4.2	± 4.4	-
Child-Pugh-Turcotte (CPT) Score			
CPT scores are used to assess the severity of cirrhosis. Scores can range from 5 to 15, with higher scores indicating a greater severity of disease. # of Participants Analyzed: Selonsertib + Prednisolone = 47; Placebo + Prednisolone = 52			
Units: Units on a scale			
arithmetic mean	10	10	
standard deviation	± 1.2	± 1.3	-
Maddrey DF Score			
Baseline Maddrey Discriminant Function (DF) score is a prognostic tool used to determine the next step of treatment based on the severity of AH. Maddrey DF score of < 32 indicates mild to moderate AH and			

a lower chance of death in the next few months. Maddrey DF score of  $\geq 32$  indicates severe AH and a higher chance of death in the next few months. The score has no bounds. # of Participants Analyzed: Selonsertib + Prednisolone = 44; Placebo + Prednisolone = 52

Units: Units on a scale			
arithmetic mean	42	38	
standard deviation	$\pm 16.9$	$\pm 11.4$	-

## End points

### End points reporting groups

Reporting group title	Selonsertib + Prednisolone
Reporting group description:	
Participants received selonsertib + prednisolone for 28 days.	
Reporting group title	Placebo + Prednisolone
Reporting group description:	
Participants received placebo-to-match selonsertib + prednisolone for 28 days.	

### Primary: Percentage of Participants with Treatment-Emergent Adverse Events (AE), Serious AEs, AEs Leading to Premature Study Drug Discontinuation, and Grade 3 or 4 Laboratory Abnormalities

End point title	Percentage of Participants with Treatment-Emergent Adverse Events (AE), Serious AEs, AEs Leading to Premature Study Drug Discontinuation, and Grade 3 or 4 Laboratory Abnormalities <sup>[1]</sup>
-----------------	--

#### End point description:

An AE was defined as any untoward medical occurrence that occurred during the course of the trial after study treatment had started. An adverse event was therefore any unfavorable and unintended sign, symptom, or disease temporally associated with the use of study drug, whether or not considered related to the study drug. An SAE is any untoward medical occurrence that at any dose results in death, are life threatening, requires hospitalization or prolongation of hospitalization or results in disability/incapacity, and congenital anomaly/birth defect. Safety Analysis Set included participants who were randomized and took at least 1 dose of study drug.

End point type	Primary
End point timeframe:	
Up to Day 28 plus 30 days	

#### Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No statistical analyses was planned for the safety outcome.

## Statistical analyses

No statistical analyses for this end point

### Secondary: Percentage of Participants with Lille Response (score < 0.45) at Day 7

End point title	Percentage of Participants with Lille Response (score < 0.45) at Day 7
End point description:	
The Lille score is a tool used to predict which participants with severe alcoholic hepatitis (AH) were not responding to corticosteroid therapy. It ranges between 0 and 1, with low scores (< 0.16) indicating complete response or positive response to steroids (continue therapy) and high scores (≥ 0.56) indicating no response or poor response to steroids (stop therapy). The Lille score was calculated using baseline factors: age, albumin, total bilirubin, serum creatinine, prothrombin time; and the change in total bilirubin between baseline (Day 1) and Day 7. Lille response was defined as having a Lille score < 0.45. Participants in the Full Analysis Set were analyzed.	
End point type	Secondary
End point timeframe:	
Day 7	

End point values	Selonsertib + Prednisolone	Placebo + Prednisolone

## Statistical analyses

Statistical analysis title	Statistical Analysis 1
Comparison groups	Selonsertib + Prednisolone v Placebo + Prednisolone
Number of subjects included in analysis	99
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.3 <sup>[6]</sup>
Method	Fisher exact

Notes:

[6] - P-value was calculated using the 2-sided Fisher's exact test and was used to explore differences between groups in the percentage of participants with response/non-response.

### Secondary: Percentage of Participants with a Lille Null Response (score ≥ 0.56) at Day 7

End point title	Percentage of Participants with a Lille Null Response (score ≥ 0.56) at Day 7
-----------------	---

---

**End point description:**

The Lille score is a tool used to predict which participants with severe AH were not responding to corticosteroid therapy. It ranges between 0 and 1, with low scores (< 0.16) indicating complete response or positive response to steroids (continue therapy) and high scores ( $\geq 0.56$ ) indicating no response or poor response to steroids (stop therapy). The Lille score was calculated using baseline factors: age, albumin, total bilirubin, serum creatinine, prothrombin time; and the change in total bilirubin between baseline (Day 1) and Day 7. Lille null response was defined as having a Lille score  $\geq 0.56$ . Participants in the Full Analysis Set were analyzed.

### Secondary: Percentage of Participants With Estimated Mortality at Month 2 and Month 6: Combined Scoring Including Lille Score at Day 7 and Baseline Model for End-Stage Liver Disease (MELD) Score

End point title	Percentage of Participants With Estimated Mortality at Month 2 and Month 6: Combined Scoring Including Lille Score at Day 7 and Baseline Model for End-Stage Liver Disease (MELD) Score
-----------------	---

#### End point description:

The Lille score is a tool used to predict which participants with severe AH were not responding to corticosteroid therapy. It ranges between 0 and 1, with low scores ( $< 0.16$ ) indicating complete response or positive response to steroids (continue therapy) and high scores ( $\geq 0.56$ ) indicating no response or poor response to steroids (stop therapy). MELD scores are used to assess prognosis and suitability for liver transplantation. Scores can range from 6 to 40, with higher scores indicating greater disease severity. A scoring system combining the Lille score at Day 7 and the baseline MELD score was used to calculate the percentage of participants expected to die by Month 2 and by Month 6. Participants in the Full Analysis Set with available data were analyzed.

End point type	Secondary

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 June 2016	<ul style="list-style-type: none"><li>-Added 2 inclusion criteria to further define the clinical diagnosis of severe AH</li><li>-Updated guidance on subject management during the hospitalization period</li><li>-Removed the interim analysis for decision-making purposes and clarified when the primary analysis would be conducted</li><li>-Updated data included for Section 1.2.5. Clinical Trials for GS-4997</li><li>-Clarified the fixed dosing of PRED (ie, no tapering of the PRED dose)</li><li>-Updated subject SEL/placebo and PRED stopping rules and a relevant paragraph in the toxicity management section of the protocol</li><li>-Added adjudication criteria for the evaluation of potential drug-induced liver injury (DILI)</li><li>-Added trial stopping criteria and clarified the Data</li></ul>
11 January 2017	<ul style="list-style-type: none"><li>-Removed information in the Introduction that was included in the current version of the Investigators Brochure</li><li>-Added data from the GS-US-384-1497 study to the Introduction</li><li>-Clarified that local laboratory testing results could be used to confirm eligibility; made other clarifications to study procedures throughout</li><li>-Added mortality assessment at Week 8 as a secondary objective</li><li>-Added assessment of changes in Fibroscan as an exploratory objective</li><li>-Updated text related to the Lille score calculation at Day 7 and PRED discontinuation for subjects with a null response at Day 7; added Lille null response as a secondary endpoint</li><li>-Added FibroScan in subjects without ascites, for sites that have instrument capability, to the study procedures</li><li>-Added exclusion criteria #10 to exclude subjects with clinical suspicion of pneumonia</li><li>-Updated exclusion criteria #21 to allow subjects to enroll if systemic corticosteroids were started 3 or fewer days before baseline/Day 1</li><li>-Updated exclusion criteria #22 to remove the prohibition of CYP3A4 inhibitors. Strong CYP3A4 inducers continued to be disallowed.</li><li>-Added standardized treatment guidelines for sepsis</li><li>-Provided guidance for the treatment of pneumonia infections</li><li>-Added text to allow subjects to be randomized and stratified by MELD score based on local laboratory testing</li><li>-Included additional biomarkers for future assessments</li><li>-Clarified reporting periods for nonserious adverse events (AEs) and serious adverse events (SAEs)</li><li>-Provided guidance on PRED dose reduction or interruption</li></ul>
04 August 2017	<ul style="list-style-type: none"><li>-Inserted updated information on efficacy results from previous clinical trials in Section 1</li><li>-HepQuant testing and all references to the HepQuant substudy were removed from the protocol.</li><li>-Clarified use of chest x-ray, HBV, HCV, HIV serology, and urine drug testing to allow results (including hospital transfers) within 10 days of screening to determine eligibility</li><li>-Added language regarding re-screening of subjects</li><li>-Clarified posttreatment visit requirements for subjects prematurely discontinued from both study drugs</li><li>-Clarified liver biopsy requirement regarding inadequate biopsy samples that do not suggest an alternative diagnosis to AH</li><li>-Clarified PK language regarding dialysis and subjects on renal replacement therapy</li><li>-Changed ALT/AST stopping criteria to exclude &gt; 5 x postbaseline nadir for ALT and AST; and allowed for investigator discretion if there is an alternative cause</li><li>-Clarified Lille score parameters for study drug discontinuation</li><li>-Updated Appendix 2 to provide further clarification on certain study procedures</li></ul>

---

Notes:
