Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	18 December 2019
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	14 November 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main objective of this study was to evaluate the efficacy of guselkumab treatment in subjects with active psoriatic arthritis (PsA) including those previously treated with biologic anti-tumor necrosis factor alpha (anti-TNF alpha) agent(s) by assessing the reduction in signs and symptoms of PsA.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with good clinical practices and applicable regulatory requirements. The safety assessments included adverse events (AEs), clinical laboratory tests, physical examinations, vital signs, suicidal ideation or behavior (using the eC-SSRS questionnaires), concomitant medication review, and early detection of tuberculosis (TB).

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	28 August 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

EEA total number of subjects	170

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	352
From 65 to 84 years	29
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

A total of 383 subjects were enrolled. Among them, 381 subjects received at least one dose of study drug (126 in placebo group, 127 in guselkumab 100 mg q8w group and 128 in guselkumab 100 mg q4w group). One subjects was randomized to guselkumab 100 mg q8w but not treated.

Pre-assignment

Screening details:

One subjects was accidentally randomized before completion of screening assessments. Subsequently, this subjects screen failed and was later re-screened and randomized using a new subjects number. Therefore, this subjects was counted twice in the number of subjects enrolled, but only once in the number of subjects randomized.

Period 1

Period 1 title	Placebo Controlled Period: Week 0 - 24
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Blinding implementation details:

Sponsor was also blinded.

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Subjects were randomized to receive placebo matched to guselkumab subcutaneous injections every 4 weeks through Week 20 in the placebo controlled period (PCP), then to receive guselkumab 100 milligrams (mg) subcutaneous injection from Week 24 every 4 weeks through Week 48 in the active treatment period.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subjects were randomized to receive placebo matched to guselkumab subcutaneous injections every 4 weeks through Week 20 in the placebo controlled period (PCP).

Arm title	Guselkumab 100 mg q8w
------------------	-----------------------

Arm description:

Subjects were randomized to receive guselkumab 100 mg subcutaneous injections at Weeks 0 and 4, then every 8 weeks (q8w) and placebo matched to guselkumab injections at other visits through Week 48.

Arm type	Experimental
Investigational medicinal product name	Guselkumab
Investigational medicinal product code	
Other name	CNT01959
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subjects were randomized to receive guselkumab 100 mg subcutaneous injections at Weeks 0 and 4,

then every 8 weeks (q8w).

Arm title	Guselkumab 100 mg q4w
Arm description: Subjects were randomized to receive guselkumab 100 mg subcutaneous injections every 4 weeks (q4w) through Week 48.	
Arm type	Experimental
Investigational medicinal product name	Guselkumab
Investigational medicinal product code	
Other name	CNT01959
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subjects were randomized to receive guselkumab 100 mg subcutaneous injections every 4 weeks (q4w) through Week 48.

Number of subjects in period 1	Placebo	Guselkumab 100 mg q8w	Guselkumab 100 mg q4w

Primary: Percentage of Subjects who Achieved an American College of Rheumatology (ACR) 20 Response at Week 24

End point title	Percentage of Subjects who Achieved an American College of Rheumatology (ACR) 20 Response at Week 24
-----------------	--

End point description:

ACR 20: $\geq 20\%$ improvement from baseline in both SJC(66 joints) and TJC(68 joints), and $\geq 20\%$ improvement from baseline in 3 of 5 assessments: patient's assessment of pain using VAS(0-100mm, 0=no pain and 100=worst possible pain), PtGA of disease activity (arthritis, VAS; 0-100mm, 0=excellent and 100=poor), PGA of disease activity (VAS; 0-100mm, 0=no arthritis activity and 100=extremely active arthritis), patient's assessment of physical function measured by HAQ-DI (20-question instrument assessing 8 functional areas; range: 0-3, 0=no difficulty, 3=inability to perform task), and CRP. TF criteria - discontinued study drug, initiated/increased dose of non-biologic DMARDs or oral corticosteroids, initiated prohibited psoriatic arthritis treatment. Analysis population is FAS1. Subjects who

achieved ACR 20 response at Week 24 and did not meet any TF criteria before Week 24 considered responders. Subjects who met 1/more TF criteria or with missing data considered non-responders.

Secondary: Change From Baseline in Health Assessment Questionnaire-Disability Index (HAQ-DI) Score at Week 24

End point title	Change From Baseline in Health Assessment Questionnaire-Disability Index (HAQ-DI) Score at Week 24
End point description:	HAQ-DI score assess functional status of subject. It is 20 question instrument that assess degree of difficulty a person has in accomplishing tasks in 8 functional areas (dressing, arising, eating, walking, hygiene, reaching, gripping, and activities of daily living). Responses in each functional area were scored from 0=indicating no difficulty, to 3=indicating inability to perform a task in that area. Total HAQ score is average of the computed categories scores ranging from 0-3 where 0=least difficulty and 3=extreme difficulty. Lower scores are indicative of better functioning. Negative change from baseline indicates improvement of physical function. Analysis population is full analysis set-1 (FAS1). Data after meeting one or more treatment failure (TF) criteria were imputed as no change from baseline. Missing data were assumed to be missing at random (MAR) and imputed using multiple imputation (MI).

Secondary: Percentage of Subjects With Psoriasis Response of IGA (Score: 0[Cleared] or 1[Minimal] and >=2 grade reduction from baseline) at Week 24

Subjects With $\geq 3\%$ Body Surface Area (BSA) Psoriatic Involvement and IGA Score of ≥ 2 (Mild) at Baseline

End point title	Percentage of Subjects With Psoriasis Response of IGA (Score: 0[Cleared] or 1[Minimal] and ≥ 2 grade reduction from baseline) at Week 24 Among Subjects With $\geq 3\%$ Body Surface Area (BSA) Psoriatic Involvement and IGA Score of ≥ 2 (Mild) at Baseline
-----------------	---

End point description:

A psoriasis Investigator's Global Assessment (IGA) response was defined as an IGA score of 0 (cleared) or 1 (minimal) and ≥ 2 grade reduction from baseline in the IGA psoriasis score. The IGA documents the investigator's assessment of the patient's psoriasis and lesions are graded for induration, erythema and scaling, each using a 5 point scale: 0 (no evidence), 1 (minimal), 2 (mild), 3 (moderate), and 4 (severe). The IGA score of psoriasis was based upon the average of induration, erythema and scaling scores. The subject's psoriasis was assessed as cleared (0), minimal (1), mild (2), moderate (3), or severe (4). FAS1 among the subjects with $\geq 3\%$ BSA psoriatic involvement and an IGA score of ≥ 2 (mild) at baseline. Subjects who achieved psoriasis IGA response at Week 24 and did not meet any TF criteria before Week 24 were considered as responders. Subjects who met 1 or more TF criteria or with missing data were considered as non-responders.

End point title	Change From Baseline in Disease Activity Score (DAS28) (C-reactive Protein [CRP]) Score at Week 24
-----------------	--

End point description:

The Disease Activity Index Score (DAS28) based on C-Reactive Protein (CRP) is an index combining tender joints (28 joints), swollen joints (28 joints), CRP and patient's global assessment of disease activity. The set of 28 joint count is based on evaluation of the shoulder, elbow, wrist, metacarpophalangeal (MCP) MCP1 to MCP5, proximal interphalangeal (PIP) PIP1 to PIP5 joints of both the upper right extremity and the upper left extremity as well as the knee joints of lower right and lower left extremities. The values are 0=best to 10=worst. Negative changes from baseline indicate improvement of arthritis. Analysis population is FAS1. Data after meeting one or more TF criteria were imputed as no change from baseline. Missing data were assumed to be MAR and imputed using MI.

Secondary: Change From Baseline in 36-Item Short Form Health Survey (SF-36) Physical Component Summary (PCS) Score at Week 24

End point title	Change From Baseline in 36-Item Short Form Health Survey (SF-36) Physical Component Summary (PCS) Score at Week 24
-----------------	--

End point description:

SF-36 is a multi-domain instrument with 36 items to evaluate the health status and quality of life. It included 8 subscales (physical functioning, physical role functioning, bodily pain, general health perception, vitality, social functioning, emotional role functioning, and mental health), which yielded a Physical Component Summary (PCS) with score range 0-100 (higher score-better quality of life) and a Mental Component Summary (MCS) with score range 0-100 (higher score-better quality of life) in addition to subscale scores. The PCS scores are normalized to a mean of 50 and standard deviations of 10, based upon general US population norms. A positive change indicates improvement while a negative change indicates worsening of health status and quality of life. Analysis population is FAS1. Data after meeting one or more TF criteria were imputed as no change from baseline. Missing data were assumed to be MAR and imputed using MI.

Secondary: Percentage of Subjects With Resolution of Enthesitis at Week 24 Among

the Subjects With Enthesitis at Baseline

End point title	Percentage of Subjects With Resolution of Enthesitis at Week 24 Among the Subjects With Enthesitis at Baseline
-----------------	--

End point description:

Enthesitis was assessed using the Leeds Enthesitis Index (LEI), a tool developed to assess enthesitis in subjects with PsA and evaluates the presence (score of 1) or absence (score of 0) of pain by applying local pressure to the following entheses: left and right lateral epicondyle humerus, left and right medial femoral condyle, and left and right achilles tendon insertion. The enthesitis index score is a total score of the 6 evaluated sites from 0 (0 sites with tenderness) to 6 (worst possible score; 6 sites with tenderness). A LEI score of 0 at a post baseline visit indicates resolution of enthesitis when baseline LEI greater than (>) 0. Analysis population is FAS1 among the subjects with enthesitis (LEI) at baseline. Subjects who achieved resolution of enthesitis at Week 24 and did not meet any TF criteria before Week 24 were considered as responders. Subjects who met 1 or more TF criteria or with missing data were considered as non-responders.

ACR 50 response was defined as $\geq 50\%$ improvement from baseline in both SJC (66 joints) and TJC (68 joints), and $\geq 50\%$ improvement from baseline in 3 of the 5 assessments: patient's assessment of pain using VAS (0-100 mm, 0=no pain and 100=worst possible pain), PtGA of disease activity (arthritis, VAS; 0-100 mm, 0=excellent and 100= poor), PGA of disease activity (VAS; 0-100 mm, 0=no arthritis activity and 100=extremely active arthritis), patient's assessment of physical function measured by HAQ-DI (defined as a 20-question instrument assessing 8 functional areas; range: 0-3, 0=indicating no difficulty, 3=indicating inability to perform a task in that area), and CRP. Analysis population is FAS1. Subjects who achieved ACR 50 response at a specific time point and did not meet any treatment failure (TF) criteria before, were considered as responders at that time point. Subjects who met 1 or more TF criteria before or with missing data at that time point were considered as nonresponders.

Secondary: ACR Component- Patient's Assessment of Physical Function as Assessed by HAQ-DI Scale Score at Weeks 4, 8, 12, 16, 20 and 24

End point title	ACR Component- Patient's Assessment of Physical Function as Assessed by HAQ-DI Scale Score at Weeks 4, 8, 12, 16, 20 and 24
-----------------	---

End point description:

Patient's assessment of physical function was measured by Disability Index of the Health Assessment Questionnaire (HAQ-DI). HAQ-DI score assess functional status of subject. It is 20 question instrument that assess degree of difficulty a person has in accomplishing tasks in 8 functional areas (dressing, arising, eating, walking, hygiene, reaching, gripping, and activities of daily living). Responses in each functional area were scored from 0=indicating no difficulty, to 3=indicating inability to perform a task in that area. Total HAQ score is average of the computed categories scores ranging from 0-3 where 0=least difficulty and 3=extreme difficulty. Lower scores are indicative of better functioning. Negative change from baseline indicates improvement of physical function. Analysis population is FAS1. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

End point title	Change From Baseline in HAQ-DI Score at Weeks 4, 8, 12, 16, 20 and 24
-----------------	---

End point description:

HAQ-DI score assess functional status of subject. It is 20 question instrument that assess degree of difficulty a person has in accomplishing tasks in 8 functional areas (dressing, arising, eating, walking, hygiene, reaching, gripping, and activities of daily living). Responses in each functional area were scored from 0=indicating no difficulty, to 3=indicating inability to perform a task in that area. Total HAQ score is average of the computed categories scores ranging from 0-3 where 0=least difficulty and 3=extreme difficulty. Lower scores are indicative of better functioning. Negative change from baseline indicates improvement of physical function.

Secondary: Change From Baseline in the Disease Activity Index for Psoriatic Arthritis (DAPSA) Score at Weeks 4, 8, 12, 16, 20 and 24

End point title	Change From Baseline in the Disease Activity Index for Psoriatic Arthritis (DAPSA) Score at Weeks 4, 8, 12, 16, 20 and 24
-----------------	---

End point description:

DAPSA assessed the joint domain of psoriatic arthritis (PsA) and was derived from the sum of the following components: tender joint count (0–68), swollen joint count (0–66), CRP level (mg/dL, value <lower limit of quantification [LLOQ] is considered equal to half of the value of LLOQ for numerical calculations), patient assessment of pain (0–10 centimeter [cm] VAS, 0=no pain, 10=worst possible pain), and patient's global assessment of disease activity on arthritis (0 to 10 cm VAS, 0=excellent and 10=poor). A higher score indicates more active disease activity. Negative changes from baseline indicate improvement of PsA disease activity. The assessment does not have a score range with an upper or lower bound. Analysis population is FAS1. Data after meeting one or more TF criteria were imputed as no change from baseline. Missing data were assumed to be MAR. The LS mean is based on MMRM model that included data from all visits for all subjects included in the model.

The IGA documents the investigator's assessment of the patient's psoriasis and lesions are graded for induration, erythema and scaling, each using a 5 point scale: 0 (no evidence), 1 (minimal), 2 (mild), 3 (moderate), and 4 (severe). The IGA score of psoriasis was based upon the average of induration, erythema and scaling scores. The subject's psoriasis was assessed as cleared (0), minimal (1), mild (2), moderate (3), or severe (4). Subjects who achieved IGA Score of 0 (cleared) at a specific timepoint and did not meet any TF criteria before, were considered as responders at that time point. Subjects who met 1 or more TF criteria before or with missing data at that time point were considered as non-responders. Analysis population is FAS1 among subjects with $\geq 3\%$ BSA psoriatic involvement and an IGA score of ≥ 2 at baseline.

Secondary: Change From Baseline in PASI Score at Weeks 16 and 24 Among the Subjects with $\geq 3\%$ BSA Psoriatic Involvement and an IGA Score of ≥ 2 (mild) at Baseline

End point title	Change From Baseline in PASI Score at Weeks 16 and 24 Among the Subjects with $\geq 3\%$ BSA Psoriatic Involvement and an IGA Score of ≥ 2 (mild) at Baseline
-----------------	--

End point description:

PASI is a tool to assess and grade severity of psoriasis and response to therapy. In PASI, body is divided into 4 areas: head, trunk, upper extremities, lower extremities. Each area was assessed separately for percentage of area involved and translated to numeric score ranging from 0 (no involvement) to 6 (90 to 100% involvement), and for erythema, induration, and scaling, each rated on scale of 0 to 4 that is none to maximum severity. PASI numeric score range from 0 (no psoriasis) to 72. Higher scores indicate more severe disease. Negative change from baseline indicates improvement of psoriasis. Analysis population is PASI among subjects who had $\geq 3\%$ BSA of psoriatic involvement and IGA score ≥ 2 (mild) at baseline. Data after meeting one/more TF criteria were imputed as no change from baseline. Missing data were assumed to be MAR. LS mean is based on MMRM model that included data from all visits for all subjects included in model.

End point title	Change from Baseline in Functional Assessment of Chronic Illness Therapy (FACIT)-Fatigue Score at Weeks 8, 16, and 24
-----------------	---

End point description:

The FACIT-Fatigue is a questionnaire that assesses self-reported tiredness, weakness, and difficulty conducting usual activities due to fatigue. The subscale consists 13-item instrument to measure fatigue. Each of the 13 items has a set of five response categories: Not at all (=0), A little bit (=1), Somewhat (=2), Quite a bit (=3) and Very much (=4). A total FACIT-Fatigue subscale score was calculated as the sum of the 13 item scores (reserved scores [4 - score]) and ranges from 0 to 52, with a higher score indicating less fatigue. Positive changes from baseline indicate improvement of fatigue. Items were reverse scored when appropriate to provide a scale in which higher scores represent better functioning or less fatigue. Analysis population is FAS1. Data after meeting one or more TF criteria were imputed as no change from baseline. Missing data were assumed to be MAR. The LS mean is based on MMRM model that included data from all visits for all subjects included in the model.

Secondary: Change from Baseline in FACIT-Fatigue Score at Week 24 by ACR 20 response at Week 24

End point title	Change from Baseline in FACIT-Fatigue Score at Week 24 by ACR 20 response at Week 24
-----------------	--

End point description:

The FACIT-Fatigue is a questionnaire that assesses self-reported tiredness, weakness, and difficulty conducting usual activities due to fatigue. The subscale consists 13-item instrument to measure fatigue. Each of the 13 items has a set of five response categories: Not at all (=0), A little bit (=1), Somewhat (=2), Quite a bit (=3) and Very much (=4). A total FACIT-Fatigue subscale score was calculated as the sum of the 13 item scores (reserved scores [4 - score]) and ranges from 0 to 52, with a higher score indicating less fatigue. Positive changes from baseline indicate improvement of fatigue. Items were reverse scored when appropriate to provide a scale in which higher scores represent better functioning or less fatigue. Analysis population is FAS1. Data after meeting one or more TF criteria were imputed as no change from baseline. Here, n (number analyzed) signifies the number of subjects who were ACR 20 responders or non-responders at Week 24.

End point title	Change From Baseline in HAQ-DI Score at Weeks 24, 28, 36, 44 and 52
-----------------	---

End point description:

HAQ-DI score assess functional status of subject. It is 20 question instrument that assess degree of difficulty a person has in accomplishing tasks in 8 functional areas (dressing, arising, eating, walking, hygiene, reaching, gripping, and activities of daily living). Responses in each functional area were scored from 0=indicating no difficulty, to 3=indicating inability to perform a task in that area. Total HAQ score is average of the computed categories scores ranging from 0-3 where 0=least difficulty and 3=extreme difficulty. Lower scores are indicative of better functioning. Negative change from baseline indicates improvement of physical function. Analysis population is FAS2. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

Secondary: Percentage of Subjects Who Achieved PASI 90 Response at Weeks 24 and 52 Among Subjects With $\geq 3\%$ BSA Psoriatic Involvement and an IGA Score of ≥ 2 at Baseline

End point title	Percentage of Subjects Who Achieved PASI 90 Response at Weeks 24 and 52 Among Subjects With $\geq 3\%$ BSA Psoriatic Involvement and an IGA Score of ≥ 2 at Baseline
-----------------	---

End point description:

PASI is a tool to assess and grade severity of psoriasis and response to therapy. In PASI, body is divided into 4 areas: head, trunk, upper extremities, lower extremities. Each area was assessed separately for percentage of area involved and translated to numeric score ranging from 0 (no involvement) to 6 (90 to 100% involvement), and for erythema, induration, and scaling, each rated on scale of 0 to 4 that is none to maximum severity. PASI numeric score range from 0 (no psoriasis) to 72. Higher scores indicate more severe disease. PASI 90 response: $\geq 90\%$ improvement in PASI score from baseline. Analysis population is FAS2 among the subjects who had $\geq 3\%$ BSA of psoriatic involvement and an IGA score ≥ 2 (mild) at baseline. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

End point title	Percentage of Subjects Who Achieved ≥ 5 Point Improvement From Baseline in SF-36 PCS Score at Weeks 24, 36 and 52
-----------------	--

End point description:

SF-36 is a multi-domain instrument with 36 items to evaluate the health status and quality of life. It included 8 subscales (physical functioning, physical role functioning, bodily pain, general health perception, vitality, social functioning, emotional role functioning, and mental health), which yielded a Physical Component Summary (PCS) with score range 0-100 (higher score-better quality of life) and a Mental Component Summary (MCS) with score range 0-100 (higher score-better quality of life) in addition to subscale scores. The PCS scores are normalized to a mean of 50 and standard deviations of 10, based upon general US population norms. Higher score indicates better outcome, with an increase of 5 points considered to be clinically meaningful. Analysis population is FAS2. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

Secondary: Percentage of Subjects Who Achieved $\geq 20\%$, $\geq 50\%$, $\geq 70\%$, and $\geq 90\%$ Improvement From Baseline in BASDAI Score at Weeks 24 and 52 Among Subjects with Spondylitis and Peripheral Arthritis as their Primary Arthritic

Presentation of PsA

End point title	Percentage of Subjects Who Achieved $\geq 20\%$, $\geq 50\%$, $\geq 70\%$, and $\geq 90\%$ Improvement From Baseline in BASDAI Score at Weeks 24 and 52 Among Subjects with Spondylitis and Peripheral Arthritis as their Primary Arthritic Presentation of PsA
-----------------	--

End point description:

BASDAI is selfassessment tool with 6 questions relating to 5 major symptoms of ankylosing spondylitis: fatigue, spinal pain, joint pain, enthesitis, qualitative and quantitative morning stiffness. First 5 items scored on 10cm VAS ranging from 0=none to 10=very severe. Quantitative morning stiffness was scored on 10cm VAS ranging from 0=0 hours to 10=2/more hours. The 2 scores for qualitative and quantitative morning stiffness were averaged, and total BASDAI score was average of 5 scores of each symptom, ranging from 0=none to 10=very severe. Higher scores indicate greater disease severity and an improvement of 50% from baseline is considered clinically meaningful. Analysis population is FAS2 among subjects with spondylitis and peripheral arthritis and BASDAI score >0 at baseline. Here, 'n' signifies number of subjects analyzed at specified timepoints.

Secondary: Change From Baseline in Enthesitis Score (Based on LEI) at Weeks 24, 36, 44 and 52 Among the Subjects With Enthesitis at Baseline

End point title	Change From Baseline in Enthesitis Score (Based on LEI) at Weeks 24, 36, 44 and 52 Among the Subjects With Enthesitis at Baseline
-----------------	---

End point description:

Enthesitis was assessed using the LEI, a tool developed to assess enthesitis in subjects with PsA and evaluates the presence (score of 1) or absence (score of 0) of pain by applying local pressure to the following entheses: left and right lateral epicondyle humerus, left and right medial femoral condyle, and left and right achilles tendon insertion. The enthesitis index score is a total score of the 6 evaluated sites from 0 (0 sites with tenderness) to 6 (worst possible score; 6 sites with tenderness). Negative changes from baseline indicate improvement of enthesitis. Analysis population is FAS2 among the subjects with enthesitis (LEI) at baseline. Here, N (number of subjects analyzed) signifies the number of subjects analyzed for this outcome measure and n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

Secondary: Change From Baseline in Dactylitis Score at Weeks 24, 36, 44 and 52 Among the Subjects With Dactylitis at Baseline

End point title	Change From Baseline in Dactylitis Score at Weeks 24, 36, 44 and 52 Among the Subjects With Dactylitis at Baseline
-----------------	--

End point description:

The presence and severity of dactylitis was assessed in both hands and feet using a scoring system from 0 to 3 (0–no dactylitis, 1–mild dactylitis, 2–moderate dactylitis, and 3–severe dactylitis) for each digit. The results were summed to produce a final score ranging from 0 to 60. A higher score indicates more severe dactylitis. Negative changes from baseline indicate improvement in dactylitis. Analysis population is FAS2 among the subjects with dactylitis at baseline. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

Secondary: Percentage of Subjects With an IGA Score of 0 (cleared) or 1 (Cleared) at Weeks 24 and 52 Among Subjects With $\geq 3\%$ BSA Psoriatic Involvement and an IGA score of ≥ 2 at Baseline

End point title	Percentage of Subjects With an IGA Score of 0 (cleared) or 1 (Cleared) at Weeks 24 and 52 Among Subjects With $\geq 3\%$ BSA Psoriatic Involvement and an IGA score of ≥ 2 at Baseline
-----------------	---

End point description:

A psoriasis IGA response was defined as an IGA score of 0 (cleared) or 1 (minimal) and ≥ 2 grade reduction from baseline in the IGA psoriasis score. The IGA documents the investigator's assessment of the patient's psoriasis and lesions are graded for induration, erythema and scaling, each using a 5 point scale: 0 (no evidence), 1 (minimal), 2 (mild), 3 (moderate), and 4 (severe). The IGA score of psoriasis was based upon the average of induration, erythema and scaling scores. The subject's psoriasis was assessed as cleared (0), minimal (1), mild (2), moderate (3), or severe (4). Analysis population is FAS2 among the subjects who had $\geq 3\%$ BSA of psoriatic involvement and an IGA score ≥ 2 (mild) at baseline. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

Secondary: Change From Baseline in SF-36 Physical Component Summary (PCS) Score at Weeks 24, 36 and 52

End point title	Change From Baseline in SF-36 Physical Component Summary (PCS) Score at Weeks 24, 36 and 52
-----------------	---

End point description:

SF-36 is a multi-domain instrument with 36 items to evaluate the health status and quality of life. It included 8 subscales (physical functioning, physical role functioning, bodily pain, general health perception, vitality, social functioning, emotional role functioning, and mental health), which yielded a Physical Component Summary (PCS) with score range 0-100 (higher score-better quality of life) and a Mental Component Summary (MCS) with score range 0-100 (higher score-better quality of life) in addition to subscale scores. The PCS scores are normalized to a mean of 50 and standard deviations of 10, based upon general US population norms. A positive change indicates improvement while a negative change indicates worsening of health status and quality of life. Analysis population is FAS2. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

Secondary: Change From Baseline in Functional Assessment of Chronic Illness Therapy (FACIT)-Fatigue Score at Weeks 24, 36 and 52

End point title	Change From Baseline in Functional Assessment of Chronic Illness Therapy (FACIT)-Fatigue Score at Weeks 24, 36 and 52
-----------------	---

End point description:

The FACIT-Fatigue is a questionnaire that assesses self-reported tiredness, weakness, and difficulty conducting usual activities due to fatigue. The subscale consists 13-item instrument to measure fatigue. Each of the 13 items has a set of five response categories: Not at all (=0), A little bit (=1), Somewhat (=2), Quite a bit (=3) and Very much (=4). A total FACIT-Fatigue subscale score was calculated as the

sum of the 13 item scores (reserved scores [4 - score]) and ranges from 0 to 52, with a higher score indicating less fatigue. Positive changes from baseline indicate improvement of fatigue. Items were reverse scored when appropriate to provide a scale in which higher scores represent better functioning or less fatigue. Analysis population is FAS2. Here, n (number analyzed) signifies the number of subjects analyzed at specified timepoints.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Up to Week 60

Adverse event reporting additional description:

Safety analysis set included subjects who were randomized at Week 0 and received at least 1 (partial or complete) administration of study agent and were analyzed according to the actual treatment received after randomization. Data for Guselkumab 100 mg q8w and q4w arms was planned to be reported separately for Week 0 to 24 and Week 0 to 60.

Assessment type	Non-systematic

Reporting groups

Reporting group title	Placebo (CP)
-----------------------	--------------

Reporting group description:

Subjects received placebo matched to guselkumab subcutaneous injections every 4 weeks through Week 20 in the placebo controlled period (CP). Data prior to the first administration of guselkumab, or through the last follow-up visit if the subject did not receive any guselkumab, were included.

Reporting group title	Guselkumab 100 mg q8w (CP)
-----------------------	----------------------------

Reporting group description:

Subjects received guselkumab 100 mg subcutaneous injections at Weeks 0 and 4, then every 8 weeks and placebo matched to guselkumab injections at other visits through Week 20 in the placebo controlled period (CP). Data through Week 24, or through the last follow-up visit if the subject did not receive any study drug at or after Week 24, were included.

Reporting group title	Guselkumab 100 mg q4w (CP)
-----------------------	----------------------------

Reporting group description:

Subjects received guselkumab 100 mg subcutaneous injections every 4 weeks from Week 0 through Week 20 in the placebo controlled period (CP). Data through Week 24, or through the last follow-up visit if the subject did not receive any study drug at or after Week 24, were included.

Reporting group title	Placebo to Guselkumab 100 mg q4w (ACP through Week 60)
-----------------------	--

Reporting group description:

Subjects who received placebo matched to guselkumab subcutaneous injections every 4 weeks through Week 20 in the placebo controlled period (CP) received guselkumab 100 mg subcutaneous injections every 4 weeks from Week 24 through Week 48. Data from the first administration of guselkumab through Week 60 were included.

Reporting group title	Guselkumab 100 mg q8w (through Week 60)
-----------------------	---

Reporting group description:

Subjects received guselkumab 100 mg subcutaneous injections at Weeks 0 and 4, then every 8 weeks and placebo matched to guselkumab injections at other visits through Week 48. Data from Week 0 through Week 60 were included.

Reporting group title	Guselkumab 100 mg q4w (through Week 60)
-----------------------	---

Reporting group description:

Subjects received guselkumab 100 mg subcutaneous injections every 4 weeks from Week 0 through Week 48. Data from Week 0 through Week 60 were included.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
25 January 2018	Amendment included the following key changes: 1) All references to Dermatology Life Quality Index and Modified Composite Psoriatic Disease Activity Index (mCPDAI) were removed as these assessments were not completed in the study, 2) Treatment failure criteria were amended to include study termination for any reason, and to remove the criterion of "Met EE criteria at Week 16 and initiated or increased the dose of one of the permitted concomitant medications", 3) To update the version names of the eC-SSRS and to clarify when the eC-SSRS should be performed during the screening visit, 4) Minor errors were corrected, and clarifications were provided throughout the protocol.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
