Figure 1. Postprandial responses of triglycerides, apoB48 and apoC-III before (●) and after evolocumab treatment (○). Area under the curve (AUC) was normalized so that 100 % corresponds to the AUC before treatment; subsequently the percentage after treatment is in reference to this value. AUC-values were calculated using the trapezoidal rule. P-values refer to a repeated measures ANOVA analysis with time point (before or after evolocumab) as factor. Stars indicate significant difference (FDR-adjusted t-test) before vs after treatment at a particular time point after the meal.
