Notes:

General information about the trial

Main objective of the trial:

The primary objective was to assess the long-term safety and tolerability of tirasemtiv in patients with ALS.

Protection of trial subjects:

The protocol and consent form were submitted by each investigator to an institutional review board (IRB), an ethics committee (EC), or a research ethics board (REB) for review and approval before study initiation. All amendments to the protocol or revisions to the consent form (if applicable) after initial IRB/EC/REB approval were submitted by the investigator to the IRB/EC/REB for review and approval before implementation. This study was conducted in accordance with the United States Code of Federal Regulations and applicable International Council on Harmonisation guidelines, consistent with Good Clinical Practice (GCP). All patients provided informed written consent before any protocol-specific procedures were performed.

Background therapy:

None

Evidence for comparator:

The CY 4033 trial was an open-label extension study of CY 4031, a randomized, double-blind, controlled study of tirasemtiv versus placebo in patients with ALS. All patients in CY 4033 had completed CY 4031. Following enrollment in CY 4033, patients received tirasemtiv at a dose of 250 mg/day, which was up-titrated to 375 mg/day at Week 4 and then 500 mg/day at Week 6. No comparator arm was used in CY 4033.

Actual start date of recruitment	17 October 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Recruitment

Recruitment details:

The study was conducted in patients with amyotrophic lateral sclerosis (ALS) between 17 October 2016 (date first patient enrolled) through 26 October 2018 (date last patient completed) at 69 sites in Belgium, Canada, France, Germany, Ireland, Italy, Netherlands, Portugal, Spain, the United Kingdom, and the United States.

Pre-assignment

Screening details:

280 patients who had completed CY 4031 enrolled in CY 4033. Patients were categorized by treatment received in CY 4031. The Delayed Start treatment group (n=115) included patients who received placebo in CY 4031 and tirasemtiv in CY 4033. The Early Start treatment group (n=165) included patients who received tirasemtiv in both CY 4031 and CY 4033.

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The primary objective of this extension study was to evaluate the long-term safety and tolerability of open-label tirasemtiv in patients who had completed participation in CY 4031. As such, no formal statistical hypothesis testing or sample size calculation was conducted. The primary endpoint of incidence of adverse events was summarized using descriptive statistics.
