

## Clinical trial results:

**A phase II study of durvalumab (MEDI4736) plus tremelimumab for the treatment of patients with advanced neuroendocrine neoplasms of gastroenteropancreatic or lung origin (the DUNE trial).**

### Summary

EudraCT number	2016-002858-20
Trial protocol	ES
Global end of trial date	06 March 2023

### Results information

Result version number	v1 (current)
This version publication date	14 December 2023
First version publication date	14 December 2023
Summary attachment (see zip file)	DUNE- Final CSR ICH synopsis 2022 (DUNE- Final CSR ICH synopsis 2022.pdf)

### Trial information

#### Trial identification

Sponsor protocol code	ESR-15-11561-61/DUNE
-----------------------	----------------------

#### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT03095274
WHO universal trial number (UTN)	-

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	14 February 2023
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	06 March 2023
Was the trial ended prematurely?	No

Notes:

---

## General information about the trial

Main objective of the trial:

Cohorts 1 to 3: Clinical benefit rate by Response Evaluation Criteria In Solid Tumors (RECIST) v1.1, which is defined as the percentage of patients achieving complete response, partial response, or stable disease at month 9 after durvalumab plus tremelimumab was started.

Cohort 4: Overall survival rate, which is defined as the percentage of patients alive at month 9 after durvalumab plus tremelimumab was started.

Protection of trial subjects:

This assignment will designate the user as the primary user for the listed clinical trial in regards to result related information. It will enable them to prepare and post result related information for this trials on behalf of the sponsor in accordance with Commission Guideline 2012/C 302/03 and its technical guidance on the format of the data fields of result-related information on clinical trials submitted in accordance with article 57(2) of Regulation (EC) No 726/2004 and article 41(2) of Regulation (EC) No 1901/2006.

Background therapy:

Well-differentiated gastroenteropancreatic and lung neuroendocrine tumors are generally malignancies with a prolonged natural history. However, clinical behavior is heterogeneous and when tumor progression is observed, treatment options are limited. The most used therapy for neuroendocrine tumors management are somatostatin analogs, with clear evidence of antitumor activity demonstrated by two phase III clinical trials in gastroenteropancreatic neuroendocrine tumors. However, even the use in lung carcinoids is quite usual, no antitumoral activity has been demonstrated in prospective clinical trials. In recent years, targeted therapies as sunitinib and everolimus have been approved for pancreatic neuroendocrine tumors and recently everolimus have showed a significant reduction in the risk of progression or death in patients with non-functional neuroendocrine tumors of lung and gastrointestinal origin. After the failure of these therapies, no drugs have demonstrated efficacy. Only Interferon alpha-2b is an option for these patients who have worsening symptoms of carcinoid syndrome while on treatment with somatostatin analogs and have showed some evidence of antitumoral activity in neuroendocrine tumors. The efficacy of Interferon alpha 2-b is not fully understood, but one of its antitumoral mechanisms of action could be related via stimulation of T cells. Tremelimumab and Durvalumab combination could be more efficient drugs to improve immune system activation and could obtain a significantly higher clinical benefit in these patients. We have analyzed presence of tumor-infiltrating lymphocytes (TILS) in these tumor types.

Evidence for comparator:

Tremelimumab and Durvalumab

combination could be more efficient drugs to improve immune system activation and could obtain a significantly higher clinical benefit in these patients. We have analyzed presence of tumor-infiltrating lymphocytes (TILS) in these tumor types. We found a high number of TILS that could be activated through Tremelimumab and Durvalumab. In cases of advanced high-grade G3 neuroendocrine carcinomas (NEC), regardless of the site of the primary tumor, combination chemotherapy using cisplatin/etoposide is recommended in first-line setting (provided that the patient has adequate organ function and performance status). There is no established second-line therapy for poorly differentiated neuroendocrine carcinomas of the gastroenteropancreatic origin.

Tremelimumab and Durvalumab would be the first immune combination agents showing efficacy in neuroendocrine neoplasms of different origins.

Actual start date of recruitment	02 January 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 123
Worldwide total number of subjects	123
EEA total number of subjects	123

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	123
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

#### Recruitment details:

This is a prospective, multi-center, open label, stratified, exploratory phase II study evaluating the efficacy and safety of durvalumab plus tremelimumab in different cohorts of patients with neuroendocrine neoplasms.

### Pre-assignment

#### Screening details:

Cohort 1: Well-moderately differentiated lung neuroendocrine tumors (classically known as typical and atypical carcinoids) after progression to somatostatin analogs and one prior targeted therapy or chemotherapy.

Cohort 2: G1/G2 (WHO grade 1 and 2) gastrointestinal neuroendocrine tumors after progression to somatostatin analogs and one prior targ

### Period 1

Period 1 title	Treatment and follow-up
Is this the baseline period?	No
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

### Arms

<b>Arm title</b>	Expeimental: Durvalumab+Tremelimumab
------------------	--------------------------------------

#### Arm description:

Patients will receive 1500 mg durvalumab via IV infusion q4w for up to 4 doses/cycles and 75 mg tremelimumab via IV infusion q4w for up to 4 doses/cycles, and then continue 1500 mg durvalumab q4w starting on Week 16 for up to 8 months (9 doses). Dosing outside the window should be discussed with the Study Physician. Tremelimumab will be administered first. Durvalumab infusion will start approximately 1 hour after the end of tremelimumab infusion. The duration will be approximately 1 hour for each infusion. A 1-hour observation period is required after the first infusion of durvalumab and tremelimumab. If no clinically significant infusion reactions are observed during or after the first cycle, subsequent infusion observation periods can be at the Investigator's discretion

Arm type	Experimental
Investigational medicinal product name	Durvalumab
Investigational medicinal product code	MEDI4736I
Other name	
Pharmaceutical forms	Concentrate and solvent for concentrate for solution for infusion
Routes of administration	Intracavernous use

#### Dosage and administration details:

Patients will receive 1500 mg durvalumab via IV infusion q4w for up to 4 doses/cycles and 75 mg tremelimumab via IV infusion q4w for up to 4 doses/cycles, and then continue 1500 mg durvalumab q4w starting on Week 16 for up to 8 months (9 doses). Dosing outside the window should be discussed with the Study Physician. Tremelimumab will be administered first. Durvalumab infusion will start approximately 1 hour after the end of tremelimumab infusion. The duration will be approximately 1 hour for each infusion. A 1-hour observation period is required after the first infusion of durvalumab and tremelimumab. If no clinically significant infusion reactions are observed during or after the first cycle, subsequent infusion observation periods can be at the Investigator's discretion (suggested 30 minutes after each durvalumab and tremelimumab infusion).

<b>Number of subjects in period 1</b>	Expeimental: Durvalumab+Tremelimumab
Started	123
Completed	123

## Period 2

Period 2 title	Baseline
Is this the baseline period?	Yes <sup>[1]</sup>
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

## Arms

<b>Arm title</b>	PATIENTS WITH ADVANCED NEUROENDOCRINE NEOPLASMS OF GASTROENTER
------------------	--

### Arm description:

Screening will occur between Day -28 and Day -1. The purpose of the screening period is to establish protocol eligibility. Informed consent will be obtained up to 4 weeks prior to Cycle 1 Day 1 and after the study has been fully explained to each subject and prior to the conduct of any screening procedures or assessments.

The purpose of the baseline visit is to establish disease characteristics prior to allocation and treatment and to confirm protocol eligibility as specified in the inclusion/exclusion criteria. Results of baseline assessments must be obtained prior to the first dose of study drug (Cycle 1/Day 1). Baseline assessments may be performed on Day -1 or on Cycle 1/Day 1 prior to dosing. Clinical laboratory tests including pregnancy test (where applicable) can be performed within 72 hours of the first dose of study drug. Subjects who complete the baseline visit and continue to meet the criteria for inclusion/exclusion will begin the treatment phase of this study.

Arm type	Experimental
Investigational medicinal product name	Not treatment period
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for concentrate for solution for infusion
