

Clinical trial results:

Prospective, Randomised, Controlled Phase 2 Study Investigating the Haemostatic Efficacy and Safety of Fibrinogen Concentrate (Octafibrin) and Cryoprecipitate as Fibrinogen Supplementation Sources in Patients Undergoing Cytoreductive Surgery for Pseudomyxoma Peritonei.

Summary

EudraCT number	2016-003749-27

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	19 December 2018
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	20 July 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to compare the overall (i.e. intra- and postoperative) haemostatic efficacy (ability to stop bleeding) of Octafibrin, a human blood-derived protein with that of cryoprecipitate in bleeding patients developing acquired fibrinogen deficiency during removal of tumour growth from the abdomen (cytoreductive surgery) for Pseudomyxoma Peritonei (PMP).

Protection of trial subjects:

This trial was conducted in accordance to the principles of ICH- GCP, ensuring that the rights, safety and well-being of patients are protected and in consistency with the Declaration of Helsinki.

Inclusion and exclusion criteria were carefully defined in order to protect subjects from contraindications, interactions with other medication and risk factors associated with the investigational medicinal product.

Throughout the study safety was assessed, such as collecting information (e.g., frequency, severity, causality) on adverse events (AEs), treatment-emergent adverse events (TEAEs), serious AEs (SAEs) and adverse drug reactions (ADRs). In addition, monitoring of vital signs, routine clinical laboratory assessment including of coagulation parameters and viral safety testing were performed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	13 March 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 45
Worldwide total number of subjects	45
EEA total number of subjects	45

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0

Adolescents (12-17 years)	0
Adults (18-64 years)	31
From 65 to 84 years	14
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Patients undergoing cytoreductive surgery for Pseudomyxoma peritonei with need of Fibrinogen supplementation were screened according to predefined in- and exclusion criteria.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Octafibrin
Arm description: -	
Arm type	Experimental
Investigational medicinal product name	Octafibrin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

Octafibrin was administered by IV injection, using an established IV route. The first dose of Octafibrin (4 g) was pre-emptively administered based on clinical judgement for fibrinogen supplementation made at the 'bleeding risk assessment' time point, which took place approximately 60–90 minutes after the beginning of surgery, before 2 L of blood had been lost.

Further Octafibrin administration intraoperatively was based on the FIBTEM test of the ROTEM® analysis. A FIBTEM A20 of 12 mm or less triggered the administration of 4 g Octafibrin. Any administration of Octafibrin during the first 24 hours postoperatively was based on clinical judgement of need for further haemostatic support and guided by the FIBTEM test of the ROTEM® analysis. A FIBTEM A20 of 12 mm or less triggered the administration of 2 g Octafibrin.

Arm title	Cryoprecipitate
Arm description: -	
Arm type	Active comparator
Investigational medicinal product name	Cryoprecipitate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

Cryoprecipitate was used as comparator and administered by IV injection, using an established IV route. A single unit contained a mean of approximately 400–460 mg fibrinogen. First dose of cryoprecipitate (2 pools of 5 units each) was pre-emptively administered based on clinical judgement for fibrinogen supplementation made at the 'bleeding risk assessment' time point, which took place approximately 60–90 minutes after the beginning of surgery, before 2 L of blood had been lost. Further cryoprecipitate administration intraoperatively was based on the FIBTEM test of the ROTEM® analysis. A FIBTEM A20 of 12 mm or less triggered the administration of 2 cryoprecipitate pools of 5 units each. Any administration of cryoprecipitate during the first 24 hours postoperatively was based on clinical judgement of need for further haemostatic support and guided by the FIBTEM test of the ROTEM® analysis. A FIBTEM A20 of 12 mm or less triggered the administration of 1 cryoprecipitate pool of 5 units.

Primary: Frequency of the Overall Haemostatic Success Adjudicated by the IDMEAC (PP-population)

End point title	Frequency of the Overall Haemostatic Success Adjudicated by the IDMEAC (PP-population) ^[1]
End point description: The primary efficacy endpoint was the overall haemostatic efficacy rating as assessed by the IDMEAC. Haemostatic efficacy was rated as 'excellent,' 'good,' 'moderate,' or 'none'. Ratings of 'excellent' and 'good' were considered 'haemostatic success', whereas ratings of 'moderate' and 'none' were considered 'haemostatic failure'. In the primary analysis population (PP set), 100% (95% CI 83.89–100.0%) of 21 patients in the Octafibrin group and 100% (95% CI 84.56–100.0%) of the 22 patients in the cryoprecipitate group were adjudicated as having achieved 'treatment success'.	
End point type	Primary
End point timeframe: Overall haemostatic efficacy was determined using a predefined composite assessment algorithm based on the intraoperative and postoperative efficacy assessments and was adjudicated in a treatment-blinded manner by the IDMEAC.	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Due to the pathological situation (both success probabilities being equal to 1) no statistical inference on difference in proportions can be performed.

----------------	---------

End point timeframe:

Treatment success assessed intraoperatively and postoperatively.

Notes:

[2] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Due to the pathological situation (both success probabilities being equal to 1) the statistical test was performed by adding/subtracting a small epsilon (0.00001) to the subject count per treatment group. Non-inferiority margin = 0.2
