

Clinical trial results:

A Double-blind, Randomized, Placebo-controlled Study to Evaluate the Efficacy and Safety of Intranasal Esketamine in Addition to Comprehensive Standard of Care for the Rapid Reduction of the Symptoms of Major Depressive Disorder, Including Suicidal Ideation, in Adult Subjects Assessed to be at Imminent Risk for Suicide

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 April 2019
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	11 April 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main objective of the study was to evaluate the efficacy of intranasal esketamine 84 milligram (mg) compared with intranasal placebo in addition to comprehensive standard of care in reducing the symptoms of major depressive disorder (MDD), including suicidal ideation, in subjects who were assessed to be at imminent risk for suicide, as measured by the change from baseline on the montgomery-asberg depression rating scale (MADRS) total score at 24 hours post first dose.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with good clinical practices and applicable regulatory requirements. Safety evaluation included adverse events, clinical laboratory tests (hematology, serum chemistry, and urinalysis), vital sign measurements (temperature, pulse/heart rate, respiratory rate, blood pressure [BP]), physical examinations, height, body weight, electrocardiograms (ECGs), pulse oximetry, and nasal examinations. Other safety evaluations included: Modified observer's assessment of alertness/sedation (MOAA/S) to measure treatment-emergent sedation, clinician-administered dissociative states scale (CADSS) to assess dissociative symptoms, and the columbia classification algorithm for suicide assessment (C-CASA) to classify potentially suicide-related events based on responses to the suicide ideation and behavior assessment tool (SIBAT).

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 17
Country: Number of subjects enrolled	Austria: 9
Country: Number of subjects enrolled	Belgium: 3
Country: Number of subjects enrolled	Brazil: 36
Country: Number of subjects enrolled	Canada: 1
Country: Number of subjects enrolled	Czech Republic: 3
Country: Number of subjects enrolled	Spain: 10
Country: Number of subjects enrolled	France: 25
Country: Number of subjects enrolled	Lithuania: 4
Country: Number of subjects enrolled	Poland: 33
Country: Number of subjects enrolled	Turkey: 23
Country: Number of subjects enrolled	United States: 66

Worldwide total number of subjects	230
EEA total number of subjects	87

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	230
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Total 230 subjects were randomly assigned to 1 of 2 treatment groups (esketamine and placebo) in a 1:1 ratio. Out of which 114 and 113 subjects received treatment in esketamine and placebo group respectively. Total 166 subjects completed the study.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo + Standard of Care (SOC)

Arm description:

Subjects self-administered intranasal placebo (1 spray in each nostril at 0, 5 and 10 minutes using 3 devices on a single day) twice per week for 4 weeks on days 1, 4, 8, 11, 15, 18, 22, and 25 along with SOC antidepressant treatment (determined by the physician based on clinical judgment and practice guidelines) on Day 1 and continued for the duration of the double-blind (DB) treatment phase.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Nasal spray, solution
Routes of administration	Intranasal use

Dosage and administration details:

Subjects self-administered intranasal placebo (1 spray in each nostril at 0, 5 and 10 minutes using 3 devices on a single day) twice per week for 4 weeks on days 1, 4, 8, 11, 15, 18, 22, and 25 in the double-blind treatment phase.

Arm title	Esketamine 84 mg + SOC
------------------	------------------------

Arm description:

Subjects self-administered esketamine 84 milligram (mg) (1 spray containing esketamine 14 mg in each nostril at 0, 5 and 10 minutes using 3 devices on a single day) twice per week for 4 weeks on Days 1, 4, 8, 11, 15, 18, 22, and Day 25 along with SOC antidepressant treatment (determined by physician based on clinical judgment and practice guidelines) on Day 1 and continued for duration of DB treatment phase. After Day 1, a single dose reduction from esketamine 84 mg to esketamine 56 mg was permitted if a subject was unable to tolerate intranasal esketamine 84 mg dose. Subjects for whom dose was reduced continued to receive reduced dose for duration of DB treatment phase.

Arm type	Experimental
Investigational medicinal product name	Esketamine
Investigational medicinal product code	
Other name	JNJ-54135419
Pharmaceutical forms	Nasal spray, solution
Routes of administration	Intranasal use

Dosage and administration details:

Subjects self-administered esketamine 84 mg (1 spray containing esketamine 14 mg in each nostril at 0, 5 and 10 minutes using 3 devices on a single day) twice per week for 4 weeks on Days 1, 4, 8, 11, 15, 18, 22, and Day 25 in the double-blind treatment phase.

Number of subjects in period 1	Placebo + Standard of Care (SOC)	Esketamine 84 mg + SOC
Started	115	115

Primary: Change From Baseline in the Montgomery-Asberg Depression Rating Scale (MADRS) Total Score at 24 Hours Post First Dose (Last Observation Carried Forward [LOCF] Data): Double-blind (DB) Treatment Phase

End point title	Change From Baseline in the Montgomery-Asberg Depression Rating Scale (MADRS) Total Score at 24 Hours Post First Dose (Last Observation Carried Forward [LOCF] Data): Double-blind (DB) Treatment Phase
End point description:	
MADRS is clinician-rated scale designed to used in subjects with Major Depressive Disorder (MDD) to measure depression severity and detect changes due to antidepressant treatment. It evaluates apparent sadness, reported sadness, inner tension, sleep, appetite, concentration, lassitude, interest level, pessimistic and suicidal thoughts. Instrument consists of 10 items, each of which is scored from 0 (item not present or normal) to 6 (severe or continuous presence of symptoms), for total possible score of 0 to 60. Higher scores represent more severe condition. Negative change in score indicates improvement. Full efficacy analysis set included all randomized subjects who received at least 1 dose of intranasal study agent during DB treatment phase and had both baseline and post baseline evaluation for MADRS total score or clinical global impression-severity of suicidality-revised (CGI-SS-R). Here 'N' (number of subjects analyzed) signifies number of subjects evaluable for this endpoint.

EQ-5D-5L consists of EQ-5D-5L descriptive system and EQ visual analogue scale (EQ-VAS). EQ-5D-5L

descriptive system comprises 5 dimensions: mobility, self-care, usual activities, pain/discomfort and anxiety/depression. Each has 5 levels of perceived problems (no problem, slight, moderate, severe and extreme problems). Subject selects answer for each of 5 dimensions considering response that best matches his/her health "today". Responses were used to generate Health Status Index (HSI). HSI ranges from 0-1.00 (dead-full health). EQ-VAS self-rating records respondent's own assessment of his/her overall health status at time of completion, on a scale of 0 (worst imaginable health)-100 (best imaginable health). Sum score ranges from 0 -100. Higher score indicates worse health state. Analysis was performed on full efficacy analysis set. Here 'N' (number of subjects analyzed) = subjects evaluable for this endpoint and 'n' (number analyzed) = subjects evaluable for each specified time point.

Secondary: Treatment Satisfaction Questionnaire for Medication (TSQM-9) Domain Score: DB Treatment Phase

End point title	Treatment Satisfaction Questionnaire for Medication (TSQM-9) Domain Score: DB Treatment Phase
-----------------	---

End point description:

The TSQM-9 is a 9-item generic patient-reported outcome instrument to assess subjects' satisfaction with medication. It covers domains of effectiveness, convenience, and global satisfaction. The TSQM-9 domain scores were calculated as recommended by the instrument authors. (i) Effectiveness = [(item 1 + item 2 + item 3) - 3]/18*100, (ii) Convenience = [(item 4 + item 5 + item 6) - 3]/18*100 and (iii) Global satisfaction = [(item 7 + item 8 + item 9) - 3]/14*100. Each domain score can be calculated only if all the three items considered in the calculation of that score are not missing. The TSQM-9 domain scores range from 0 to 100, with higher scores representing higher satisfaction. Analysis was performed on full efficacy analysis. Here, 'n' (number analyzed) signifies number of subjects evaluable for each specified time point for each specified category.

End point description:

MOAA/S was used to measure treatment-emergent sedation with correlation to levels of sedation defined by the american society of anesthesiologists (ASA) continuum. The MOAA/S scores range from 0 to 5 where, 0 = no response to painful stimulus; ASA continuum = general anesthesia, 1 = responds to trapezius squeeze; ASA continuum = deep sedation, 2 = purposeful response to mild prodding or mild shaking; ASA continuum = moderate sedation, 3 = responds after name called loudly or repeatedly; ASA continuum = moderate sedation, 4 = lethargic response to name spoken in normal tone; ASA continuum = moderate sedation and 5 = readily responds to name spoken in normal tone (awake); ASA continuum = minimal sedation. Safety analysis set included all randomized subjects who received at least 1 dose of study drug in the DB treatment phase.

Secondary: Number of Subjects With an Increase in Clinician-administered Dissociative States Scale (CADSS) Total Score: DB Treatment Phase

End point title	Number of Subjects With an Increase in Clinician-administered Dissociative States Scale (CADSS) Total Score: DB Treatment Phase
-----------------	---

End point description:

The CADSS is an instrument for the measurement of present-state dissociative symptoms and was administered to assess treatment-emergent dissociative symptoms. The CADSS consists of 23 subjective items, divided into 3 components: depersonalization, derealization, and amnesia. Subject's responses were coded on a 5-point scale (0 = not at all to 4 = extremely). Number of subjects with an increase in CADSS total score (increase based on maximum CADSS total score change from predose of > 0) was reported. Safety analysis set included all randomized subjects who received at least 1 dose of study drug in the DB treatment phase. Here, 'n' (number analyzed) signifies number of subjects evaluable for each specified time point.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From screening up to Day 25

Adverse event reporting additional description:

Safety analysis set included all randomized subjects who received at least 1 dose of study drug in the double-blind treatment phase.

Assessment type	Non-systematic

Reporting groups

Reporting group title	Esketamine 84 mg + SOC
-----------------------	------------------------

Reporting group description:

Subjects self-administered esketamine 84 milligram (mg) (1 spray containing esketamine 14 mg in each nostril at 0, 5 and 10 minutes using 3 devices on a single day) twice per week for 4 weeks on Days 1, 4, 8, 11, 15, 18, 22, and Day 25 along with SOC antidepressant treatment (determined by physician based on clinical judgment and practice guidelines) on Day 1 and continued for duration of DB treatment phase. After Day 1, a single dose reduction from esketamine 84 mg to esketamine 56 mg was permitted if a subject was unable to tolerate intranasal esketamine 84 mg dose. Subjects for whom dose was reduced continued to receive reduced dose for duration of DB treatment phase.

Reporting group title	Placebo + Standard of Care (SOC)
-----------------------	----------------------------------

Reporting group description:

Subjects self-administered intranasal placebo (1 spray in each nostril at 0, 5 and 10 minutes using 3 devices on a single day) twice per week for 4 weeks on days 1, 4, 8, 11, 15, 18, 22, and 25 along with SOC antidepressant treatment (determined by the physician based on clinical judgment and practice guidelines) on Day 1 and continued for the duration of the double-blind (DB) treatment phase.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
20 April 2017	The overall reason for the amendment was to update and/or clarify protocol content based on feedback received during study initiation activities.
31 January 2018	The overall reason for the amendment was to remove the interim analysis from the protocol; to clarify that Module 3 suicide ideation and behavior assessment tool (SIBAT) is an exploratory objective; to modify the timing of screening procedures to be consistent with the time and events schedule; to clarify which potential subjects were not excluded from participation in the study due to having a positive screening test for prescribed psychostimulants that are permitted during the study; and updated text regarding the presentation of nasal examination data.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Esketamine's known characteristic effects such as dissociative symptoms, sedation, and elevation of blood pressure may have impact on blinding, to minimize this bias, protocol specified that different raters perform efficacy and safety assessments.

Notes:
