Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	14 March 2024
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	15 January 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main objective of trial is to describe the long-term (LT) safety and tolerability of ponesimod 20 milligrams (mg) in subjects with relapsing multiple sclerosis (RMS), to describe the effects of reinitiation of ponesimod treatment after interruption in subjects with RMS, to describe the long-term (LT) disease control in subjects with RMS receiving ponesimod 20 mg, and to describe the effect of a switch from teriflunomide to ponesimod 20 mg on disease control in subjects with RMS.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with Good Clinical Practices (GCP) and applicable regulatory requirements.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	13 July 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	877
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Total of 877 subjects entered this extension study from the core study (NCT02425644) and all received at least one dose of ponesimod 20 milligrams (mg) treatment.

Pre-assignment

Screening details:

Efficacy data: reporting extension set (ES) in combined analysis period (all data from randomisation in core study till extension end of study [EOS] for those who entered ES). Safety data: reporting ES in extension analysis period (all data collected on/after date of 1st intake of ponesimod till last treatment date in extension study+15 days).

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Ponesimod 20 mg (Core and Extension Study)

Arm description:

Subjects with multiple sclerosis (MS) who were treated with ponesimod 20 milligrams (mg) in the core study (2012-000540-10), and entered into this extension study, received a 14-day gradual up-titrated treatment (from 2 mg to 10 mg) of ponesimod tablet orally once daily from Days 1 to 14. Subjects received a daily maintenance dose of ponesimod 20 mg tablet orally once daily from Day 15 up to Week 240 or till ponesimod became commercially available in a subject's country. Subjects located in Ukraine had an extended treatment duration up to 288 weeks in the extension study due to the regional crisis.

Arm type	Experimental
Investigational medicinal product name	Ponesimod
Investigational medicinal product code	
Other name	JNJ-67896153, ACT-128800
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Subjects received ponesimod 20 mg treatment.

Arm title	Teriflunomide 14 mg (Core) Then Ponesimod 20 mg (Extension)
------------------	---

Arm description:

Subjects with multiple sclerosis (MS) who were treated with teriflunomide 14 mg in the core study (2012-000540-10), and entered into this extension study, received a 14-day gradual up-titrated treatment (from 2 mg to 10 mg) of ponesimod tablet orally once daily from Days 1 to 14. Subjects received a daily maintenance dose of ponesimod 20 mg tablet orally once daily from Day 15 up to Week 240 or till ponesimod became commercially available in a subject's country. Subjects located in Ukraine had an extended treatment duration up to 288 weeks in the extension study due to the regional crisis.

Primary: Time From Core Study Randomisation to First Confirmed Relapse

End point title	Time From Core Study Randomisation to First Confirmed Relapse ^[1]
End point description: Time to first confirmed relapse: date of first confirmed relapse (core or extension study) minus date of randomisation in core study+1 day. Relapse: new, worsening, or recurrent neurological symptoms that occurred at least 30 days after the onset of a preceding relapse, that lasted at least 24 hours, in absence of fever/infection. Confirmed relapse: when patient's symptoms worsen by increase in EDSS or FS scores, consistent to previous clinically stable assessments. Specific criteria for confirmed relapse: increase of 0.5 points on EDSS; (unless EDSS=0, then increase of 1.0-point); increase of 1.0 point in at least two FS scores; or 2.0-point increase in one FS score (excluding bladder/bowel/cerebral). Rating individual FS scores is used to rate EDSS (ordinal clinical rating scale ranging: 0 [normal]-10 [death due to MS]) along with observations/ information concerning gait and use of assistance. Extension set was used. Here, '99999' refers to data not estimable due to low number of events.	
End point type	Primary
End point timeframe: From randomisation in the core study up to the end of study (EOS) in the extension study. The actual time varied for each subjects and could be up to 98.5 months	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Only statistical analysis were planned for this endpoint. No inferential statistics were planned.

Primary: Time to First 12-week Confirmed Disability Accumulation (CDA)

End point title	Time to First 12-week Confirmed Disability Accumulation
-----------------	---

End point description:

Time to first 12-week CDA is defined as start date of the first 12-week CDA minus date of randomisation in the core study+1 day. A 12-week CDA is defined as a 12-week sustained increase from the core baseline EDSS score, which is confirmed at a scheduled visit after 12-weeks. CDA is defined as: (a) Sustained increase of at least 1.5 in EDSS for subjects with a core baseline EDSS score of 0; (b) Sustained increase of at least 1.0 in EDSS for subjects with a core baseline EDSS score of 1.0 to 5.0; (c) Sustained increase of at least 0.5 in EDSS for subjects with a core baseline EDSS score ≥ 5.5 , confirmed after 12 weeks. EDSS is an ordinal clinical rating scale ranged 0 (normal neurological examination) to 10 (death due to MS). Core baseline for efficacy: last non-missing value recorded before or on randomisation in the core study for each endpoint and subject individually. Extension set was used. Here, '99999' refers to data not estimable due to low number of events.

End point type	Primary

Primary: Change from Baseline in Expanded Disability Status Scale (EDSS)

End point title	Change from Baseline in Expanded Disability Status Scale (EDSS) ^[5]
-----------------	--

End point description:

EDSS is ordinal clinical rating scale based on standard neurological examination for assessing neurological disability and impairment in MS. Seven FS scores were rated on a scale ranged from 0 to 5 or 6 to assess visual, brain, stem, pyramidal, cerebellar, sensory, bowel and bladder, and cerebral functions while ambulation was scored on scale ranged from 0 to 12 to assess walking distance and assistance. Individual FS scores were then used in conjugation with ambulation score to obtain EDSS score which ranged from 0 (normal) to 10 (death due to MS) in 0.5 unit increments that represented higher levels of disability. Core baseline for efficacy is defined as the last non-missing value recorded before or on randomisation in the core study for each endpoint and each subject individually. Extension set was used. Here, 'N' (number of subjects analysed) signifies number of subjects evaluable for this endpoint.

End point type	Primary

Primary: Cumulative Number of Combined Unique Active Lesions (CUAL) Measured by MRI

End point title	Cumulative Number of Combined Unique Active Lesions (CUAL) Measured by MRI ^[9]
-----------------	---

End point description:

CUALs was calculated as sum of new T1 Gd+ lesions and new or enlarging T2 lesions (without double-counting of lesions) from baseline up to extension EOS based on the Magnetic resonance imaging (MRI). Average number of lesions per-patient year were reported. Results are based on a negative-binomial regression model. Core baseline for efficacy is defined as the last non-missing value recorded before or on randomisation in the core study for each outcome measure and each subject individually. Extension set included all subjects who signed informed consent to enter extension study and received one dose of ponesimod. Here, 'N' (number of subjects analysed) signifies number of subjects evaluable for this endpoint.

End point type	Primary
----------------	---------

End point timeframe:

From baseline in the core study up to the end of study (EOS) in the extension study. The actual time varied for each subject and could be up to 98.5 months

Notes:

[9] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Only statistical analysis were planned for this endpoint. No inferential statistics were planned.

Primary: Number of Subjects with Treatment-emergent Decrease of >20% Points in Percent Predicted FEV1 and FVC from Baseline

End point title	Number of Subjects with Treatment-emergent Decrease of >20% Points in Percent Predicted FEV1 and FVC from Baseline ^[27]
-----------------	--

End point description:

Number of subjects with treatment-emergent decrease of >20% points in percent predicted FEV1 and FVC from baseline were reported. Treatment-emergent is defined as events occurring from start of treatment up to treatment end date + 15 days (that is, findings not present at any assessment prior to first treatment in the extension study). Extension set included all subjects who signed informed consent to enter extension study and received one dose of ponesimod. Here, 'N' (number of subjects analysed) signifies number of subjects evaluable for this endpoint.

End point type	Primary
----------------	---------

End point timeframe:

From the start of study treatment in the extension study up to the end of study treatment + 15 days in the extension study. The actual time varied for each subject and could be up to 71.8 months + 15 days

Notes:

[27] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Only statistical analysis were planned for this endpoint. No inferential statistics were planned.

Primary: Number of Subjects with a Decrease of ≥ 200 mL or $\geq 12\%$ in FEV1 or FVC from baseline to EOT

End point title	Number of Subjects with a Decrease of ≥ 200 mL or $\geq 12\%$ in FEV1 or FVC from baseline to EOT ^[28]
-----------------	--

End point description:

Number of subjects with a decrease of ≥ 200 mL or $\geq 12\%$ in FEV1 or FVC from baseline to EOT were planned to be reported. Extension baseline for safety is the last valid non-missing assessment that is taken on or after EOT visit in the core study, and prior to first study drug intake in the extension study. Extension set included all subjects who signed informed consent to enter extension study and received one dose of ponesimod. This endpoint is not relevant as a substantial proportion of patients continued onto post-treatment disease-modifying therapy (DMT), hence it cannot provide an assessment of reversibility.

End point type	Primary

Reporting groups

Reporting group title	Ponesimod 20 mg (Core and Extension Study)
-----------------------	--

Reporting group description:

Subjects with multiple sclerosis (MS) who were treated with ponesimod 20 milligrams (mg) in the core study (2012-000540-10), and entered into this extension study, received a 14-day gradual up-titrated treatment (from 2 mg to 10 mg) of ponesimod tablet orally once daily from Days 1 to 14. Subjects received a daily maintenance dose of ponesimod 20 mg tablet orally once daily from Day 15 up to Week 240 or till ponesimod became commercially available in a subject's country. Subjects located in Ukraine had an extended treatment duration up to 288 weeks in the extension study due to the regional crisis.

Reporting group title	Teriflunomide 14 mg (Core) Then Ponesimod 20 mg (Extension)
-----------------------	---

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
28 February 2018	The main reason for this amendment was to modify the pulmonary treatment discontinuation criteria based on changes in pulmonary function variables during the study treatment.
14 May 2020	The main reasons for this amendment were: (a) To allow the analysis of biomarkers in the serum sample taken at Visit 1 (Enrollment); (b) To amend the guidance for re-initiation of study treatment in the event of study treatment interruption in order to allow patients without the identified cardiovascular risk factors to re-initiate study drug at home; (c) The efficacy assessor role is no longer defined as "independent" and, depending on site setting, can now be assumed by the primary investigator / treating neurologist; (d) To provide guidance regarding conduct of the study during the coronavirus disease (COVID)-19 (coronavirus) pandemic.
19 October 2020	The main reasons for this amendment were: (a) To inform study sites that the Independent Data Monitoring Committee (IDMC) will be disbanded after the clinical database closure of the last ponesimod double-blind study, in line with the disbandment date agreed per the IDMC Charter; (b) To provide further guidance on study conduct if/when ponesimod becomes commercially available during the study and patients are switched from study treatment to commercially available ponesimod; (c) To align the safety reporting procedures with Janssen Safety processes and standards following the integration of Actelion Safety into Janssen Safety.
20 July 2021	The main reasons for this amendment were: (a) To introduce vaccination sub-study for a sub-set of subjects to investigate the immune response induced by the Janssen COVID-19 vaccine (Ad26.COV2.S); (b) Inclusion of additional serum samples for all subjects at all scheduled visits for immunogenicity evaluations; for example, to measure anti-severe acute respiratory syndrome coronavirus-2 (SARS-CoV-2) antibody levels induced by vaccination with any COVID-19 vaccination or after recovery from COVID 19; (c) Addition of clarifications regarding conduct of the study during the COVID-19 pandemic and the administration of non-live and live vaccinations; (d) To make updates with regard to teriflunomide testing per the Aubagio prescribing information.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Due to limited availability of COVID-19 vaccine-naïve MS patients, the COVID-19 vaccination sub-study was cancelled and removed from the protocol after implementation of amendment 5.
