Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 June 2015
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	11 June 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

This study assessed the efficacy, safety, and immunogenicity of a 3-dose regimen of RotaTeq™ (V260) in healthy Chinese infants. Approximately 4040 participants at least 6 weeks and up to 12 weeks of age at the time of the first vaccination with V260 or placebo were to be enrolled and randomized (1:1) to receive either V260 or placebo. Participants were also to receive the routine China Expanded Program on Immunization (EPI) vaccines (oral poliovirus vaccine [OPV] and diphtheria, tetanus, and acellular pertussis vaccine [DTaP]) either staggered or concomitantly with V260 or placebo. All participants were followed for efficacy and safety. Immune responses to OPV and DTaP were evaluated in a subset of participants. The primary hypothesis of the study states that V260 will be efficacious in preventing any severity of rotavirus gastroenteritis as compared with placebo.

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	30 May 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	China: 4040
Worldwide total number of subjects	4040
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	4040
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

A total of 4173 participants were screened, 4040 were randomized, and 4037 received at least one dose of study vaccination.

Pre-assignment

Screening details:

The study enrolled healthy Chinese infants.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer

Arms

Are arms mutually exclusive?	Yes
Arm title	V260 with Staggered EPI

Arm description:

V260 administered as a 2 mL oral solution at age ~2, 3, and 4 months, and staggered China Expanded Program on Immunization (EPI) as follows: Oral poliovirus vaccine (OPV) administered as a 1 g oral solution at age ~2.5, 3.5, and 4.5 months, and diphtheria, tetanus, acellular pertussis vaccine (DTaP) administered as a 0.5 mL intramuscular injection at age ~3.5, 4.5, and 5.5 months.

Arm type	Experimental
Investigational medicinal product name	V260
Investigational medicinal product code	
Other name	RotaTeq™; live, oral, pentavalent rotavirus vaccine
Pharmaceutical forms	Oral solution
Routes of administration	Oral use

Dosage and administration details:

2 mL oral solution

Investigational medicinal product name	Diphtheria, tetanus, acellular pertussis vaccine (DTaP)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Suspension for injection
Routes of administration	Intramuscular use

Dosage and administration details:

0.5 intramuscular injection

Investigational medicinal product name	Oral poliovirus vaccine (OPV)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Oral solution
Routes of administration	Oral use

Dosage and administration details:

1 gram oral solution

Arm title	Placebo with Staggered EPI
------------------	----------------------------

Arm description:

Placebo administered as a 2 mL oral solution at age ~2, 3, and 4 months, and staggered EPI as follows: OPV administered as a 1 g oral solution at age ~2.5, 3.5, and 4.5 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3.5, 4.5, and 5.5 months.

Notes:

[1] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: One participant did not receive the third vaccination but continued in the study.

Baseline characteristics

Reporting groups

Reporting group title	V260 with Staggered EPI
Reporting group description: V260 administered as a 2 mL oral solution at age ~2, 3, and 4 months, and staggered China Expanded Program on Immunization (EPI) as follows: Oral poliovirus vaccine (OPV) administered as a 1 g oral solution at age ~2.5, 3.5, and 4.5 months, and diphtheria, tetanus, acellular pertussis vaccine (DTaP) administered as a 0.5 mL intramuscular injection at age ~3.5, 4.5, and 5.5 months.	
Reporting group title	Placebo with Staggered EPI
Reporting group description: Placebo administered as a 2 mL oral solution at age ~2, 3, and 4 months, and staggered EPI as follows: OPV administered as a 1 g oral solution at age ~2.5, 3.5, and 4.5 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3.5, 4.5, and 5.5 months.	
Reporting group title	V260 with Concomitant EPI
Reporting group description: V260 administered as a 2 mL oral solution at age ~2, 3, and 4 months, and concomitant EPI as follows: OPV administered as a 1 g oral solution at age ~2, 3, and 4 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3, 4, and 5 months.	
Reporting group title	Placebo with Concomitant EPI
Reporting group description: Placebo administered as a 2 mL oral solution at age ~2, 3, and 4 months, and concomitant EPI as follows: OPV administered as a 1 g oral solution at age ~2, 3, and 4 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3, 4, and 5 months.

Primary: Number of Participants with Any Severity of Rotavirus Gastroenteritis

End point title	Number of Participants with Any Severity of Rotavirus Gastroenteritis
-----------------	-----------------------------------------------------------------------

End point description:

The number of participants with rotavirus gastroenteritis (RVGE) caused by naturally-occurring wild-type rotavirus (regardless of serotype or disease severity) was assessed. The case definition of RVGE included 1) 3 or more watery or looser-than-normal stools within a 24-hour period and/or forceful vomiting, and 2) naturally-occurring wild-type rotavirus must be detected in a stool specimen taken within 7 days after the onset of symptoms. The population was participants who were vaccinated in either the staggered EPI or concomitant EPI groups, were not protocol violators, and were classified as evaluable for RVGE according to the per-protocol case definition.

End point type	Primary
----------------	---------

End point timeframe:

From 14 days after the third dose of V260 or placebo through the first rotavirus season (up to 15 months)

End point values	V260 with Staggered or Concomitant EPI	Placebo with Staggered or Concomitant EPI		
Subject group type	Subject analysis set	Subject analysis set		
Number of subjects analysed	1927	1937		
Units: Participants	34	109		

Statistical analyses

Statistical analysis title	Vaccine Efficacy
Comparison groups	V260 with Staggered or Concomitant EPI v Placebo with Staggered or Concomitant EPI
Number of subjects included in analysis	3864
Analysis specification	Pre-specified
Analysis type	other ^[1]
P-value	< 0.001 ^[2]
Method	Poisson distribution
Parameter estimate	Vaccine efficacy
Point estimate	69.3
Confidence interval	
level	95 %
sides	2-sided
lower limit	54.5
upper limit	79.7

Notes:

[1] - V260 will be considered efficacious if the lower bound of the two-sided confidence interval for efficacy is >0% at the final analysis

[2] - To calculate the confidence interval and associated p-value, an exact conditional method based on a Poisson distribution was used.

Secondary: Percentage of Participants with Elevated Temperature

End point title	Percentage of Participants with Elevated Temperature
-----------------	------------------------------------------------------

End point description:

Elevated temperature (temperature $\geq 37.5^{\circ}\text{C}$ axillary or equivalent) was noted by the guardian and

recorded on the Vaccination Report Card during Day 1 to Day 14 after each dose of vaccination. Elevated temperature reported by the guardian was also collected as an adverse event (pyrexia) during Day 15 to Day 30 after each dose of vaccination. The percentage of participants with axillary temperature ≥ 37.5 °C or an adverse event of pyrexia was assessed. The population was All Subjects as Treated with follow-up specific to the endpoint.

End point type	Secondary
End point timeframe:	
Up to 30 days after any dose of V260 or Placebo	

End point values	V260 with Staggered or Concomitant EPI	Placebo with Staggered or Concomitant EPI

Statistical analyses

No statistical analyses for this end point

Secondary: Percentage of Participants with Any Adverse Event

End point title	Percentage of Participants with Any Adverse Event
-----------------	---------------------------------------------------

End point description:

An adverse event is defined as any untoward medical occurrence in a patient or clinical investigation subject administered a pharmaceutical product and which does not necessarily have to have a causal relationship with this treatment. An adverse event can therefore be any unfavourable and unintended sign, symptom, or disease temporally associated with the use of a medicinal product or protocol-specified procedure, whether or not considered related to the medicinal product or protocol-specified procedure. Any worsening of a preexisting condition that is temporally associated with the use of the sponsor's product, is also an adverse event. The population was All Subjects as Treated with safety follow-up.

End point type	Secondary

Secondary: Percentage of Participants Seropositive to Diphtheria, Pertussis, or Tetanus Antigens

End point title	Percentage of Participants Seropositive to Diphtheria, Pertussis, or Tetanus Antigens ^[5]
-----------------	------------------------------------------------------------------------------------------------------

End point description:

The percentage of participants seropositive to diphtheria, pertussis, or tetanus antigens was assessed. Seropositive was defined as the following: 1) anti-diphtheria antibody titers ≥ 0.1 International Units (IU)/mL, 2) anti-tetanus antibody titers ≥ 0.1 IU/mL, 3) antipertussis toxin antibody titers ≥ 20 Enzyme-linked Immunosorbent Assay (ELISA) Units (EU)/mL, 4) anti-pertussis filamentous hemagglutinin (FHA) antibody titers ≥ 20 EU/mL. This outcome was evaluated only in participants receiving concomitant administration of V260 or placebo and EPI. The population was participants in the concomitant EPI groups who receive their scheduled doses of DTaP without intervening disease specific to the antigen before the blood sample collection postdose 3, adhere to the guidelines for administration of vaccine, and have valid values available for analysis within specified day ranges.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline and between 28 and 51 days after the third DTaP vaccination

Notes:

[5] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: This endpoint was evaluated only in participants receiving concomitant administration of V260 or placebo and EPI.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All Adverse Events: up to 30 days after any V260 or placebo vaccination; Serious Adverse Events: from the time of written consent until the end of the study (up to 15 months)

Adverse event reporting additional description:

The at-risk population was All Subjects as Treated. Adverse events are reported for participants who received V260 or placebo without regard to staggered or concomitant EPI administration.

Assessment type	Systematic

Reporting groups

Reporting group title	Placebo with Staggered or Concomitant EPI
-----------------------	-------------------------------------------

Reporting group description:

Placebo administered as a 2 mL oral solution at age ~2, 3, and 4 months, and staggered EPI as follows: OPV administered as a 1 g oral solution at age ~2.5, 3.5, and 4.5 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3.5, 4.5, and 5.5 months OR concomitant EPI as follows: OPV administered as a 1 g oral solution at age ~2, 3, and 4 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3, 4, and 5 months.

Reporting group title	V260 with Staggered or Concomitant EPI
-----------------------	----------------------------------------

Reporting group description:

V260 administered as a 2 mL oral solution at age ~2, 3, and 4 months, and staggered EPI as follows: OPV administered as a 1 g oral solution at age ~2.5, 3.5, and 4.5 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3.5, 4.5, and 5.5 months OR concomitant EPI as follows: OPV administered as a 1 g oral solution at age ~2, 3, and 4 months, and DTaP administered as a 0.5 mL intramuscular injection at age ~3, 4, and 5 months.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 March 2014	Amendment 1: the participant cohorts were reorganized as "Staggered Use" and Concomitant Use" groups; randomization ratio was clarified as 1:1 for V260:Placebo; sample sizes for study subgroups were changed; clarified that OPV and DTaP will be provided through routine health care (China EPI); changes to the timing and volumes of certain blood draws; changes to certain AE collection times; clarification of temperature assessment method; updated power calculations to reflect reduced subgroup sample sizes.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
