

## Clinical trial results:

### Six-month, Randomized, Open-label, Parallel-group Comparison of SAR341402 to NovoLog®/NovoRapid® in Adult Patients With Diabetes Mellitus Also Using Insulin Glargine, with a 6-month Safety Extension Period

#### Summary

EudraCT number	2017-000091-28
Trial protocol	HU FI DE PL
Global end of trial date	12 January 2019

#### Results information

Result version number	v2 (current)
This version publication date	14 November 2020
First version publication date	22 January 2020
Version creation reason	<ul style="list-style-type: none"><li>New data added to full data set</li><li>Subgroup analysis data were added to full data set</li></ul>

#### Trial information

##### Trial identification

Sponsor protocol code	EFC15081
-----------------------	----------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT03211858
WHO universal trial number (UTN)	U1111-1191-5775
Other trial identifiers	Study name: Gemelli 1

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	24 May 2019
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	12 January 2019
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To demonstrate non-inferiority of SAR341402 versus NovoLog/NovoRapid in glycated hemoglobin A1c (HbA1c) change from baseline to Week 26 in subjects with type 1 or type 2 diabetes mellitus (T1DM or T2DM) also using Lantus®.

Protection of trial subjects:

Subjects were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the subject and considering the local culture. During the course of the trial, subjects were provided with individual subject cards indicating the nature of the trial the subject is participating, contact details and any information needed in the event of a medical emergency. Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy:

Insulin glargine 100 units per millilitre (U/mL) (Lantus) was given as the mandatory background basal insulin therapy and was injected once daily (QD) subcutaneously consistent with the local label. Doses of Lantus were adjusted to achieve glycemic target for fasting, pre-prandial plasma glucose between 4.4 to 7.2 millimoles per litre (mmol/L) (80 to 130 milligram/decilLitre [mg/dL]) without hypoglycemia.

Evidence for comparator: -

Actual start date of recruitment	02 August 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 56
Country: Number of subjects enrolled	Finland: 23
Country: Number of subjects enrolled	Germany: 26
Country: Number of subjects enrolled	Hungary: 73
Country: Number of subjects enrolled	Japan: 65
Country: Number of subjects enrolled	Russian Federation: 19
Country: Number of subjects enrolled	United States: 335
Worldwide total number of subjects	597
EEA total number of subjects	178

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	498
From 65 to 84 years	98
85 years and over	1

## Subject disposition

### Recruitment

Recruitment details:

The study was conducted at 82 centres in 7 countries. A total of 846 subjects were screened between 02 August 2017 and 29 December 2017, of which 249 subjects were screen failures. Screen failures were mainly due to HbA1c level less than (<) 7.0 percent (%) or greater than (>) 10% at the screening visit.

### Pre-assignment

Screening details:

Randomisation was stratified by HbA1c at screening visit (<8%, greater than or equal to [ $\geq$ ] 8%), prior use of NovoLog/NovoRapid (Yes, No), geographical region (Europe, United States [US], Japan) and type 1 or 2 of diabetes mellitus (T1DM/T2DM [US only]). Assigned to arms in 1:1 ratio (SAR341402: NovoLog/NovoRapid).

### Period 1

Period 1 title	Overall study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	SAR341402

Arm description:

SAR341402 100 U/mL subcutaneous (SC) injection, before meals intake on top of QD Insulin Glargine, up to Week 52.

Arm type	Experimental
Investigational medicinal product name	Insulin aspart
Investigational medicinal product code	SAR341402
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

SAR341402 100 U/mL (dose range of 1 unit to 80 units), once daily self-administered SC injection in 3 mL pre-filled disposable SoloSTAR® pens. Dose adjusted to achieve a 2-hour postprandial plasma glucose of <10mmol/L (<180mg/dL).

<b>Arm title</b>	NovoLog/NovoRapid
------------------	-------------------

Arm description:

NovoLog/NovoRapid 100 U/mL SC injection, before meals intake on top of QD Insulin Glargine, up to Week 52.

Arm type	Active comparator
Investigational medicinal product name	Insulin aspart
Investigational medicinal product code	
Other name	Novolog/Novorapid
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

NovoLog/NovoRapid 100 U/mL (dose range of 1 unit to 60 units), once daily self-administered SC injection in 3 mL pre-filled disposable FlexPens. Dose adjusted to achieve a 2-hour postprandial plasma glucose of <10mmol/L (<180mg/dL) while avoiding hypoglycemia.

<b>Number of subjects in period 1</b>	SAR341402	NovoLog/NovoRapid
Started	301	296
Treated	301	296
Completed	264	263
Not completed	37	33
Adverse Event	8	6
Non-serious Hypoglycemia	1	-
Other than specified	22	21
Poor compliance to protocol	6	2
Lack of efficacy	-	4

## Baseline characteristics

### Reporting groups

Reporting group title	SAR341402
Reporting group description: SAR341402 100 U/mL subcutaneous (SC) injection, before meals intake on top of QD Insulin Glargine, up to Week 52.	
Reporting group title	NovoLog/NovoRapid
Reporting group description: NovoLog/NovoRapid 100 U/mL SC injection, before meals intake on top of QD Insulin Glargine, up to Week 52.	

Reporting group values	SAR341402	NovoLog/NovoRapid	Total

### Primary: Change in Glycated Hemoglobin A1c (HbA1c) From Baseline to Week 26

End point title	Change in Glycated Hemoglobin A1c (HbA1c) From Baseline to Week 26
End point description: All values up to Week 26 were taken into account in the analysis, regardless of adherence to treatment. Change in HbA1c was calculated by subtracting baseline value from Week 26 value. Missing changes at Week 26 were imputed using a retrieved dropout multiple imputation method (separately for subjects who prematurely discontinued or completed treatment). Adjusted least square (LS) means and standard errors (SE) were obtained using an analysis of covariance (ANCOVA) model on data obtained from the multiple imputations (results were combined using Rubin's formulae). Analysis was performed on intent-to-treat (ITT) population, which included all randomised subjects, irrespective of compliance with the study protocol and procedures.	
End point type	Primary
End point timeframe: Baseline, Week 26	

<b>End point values</b>	SAR341402	NovoLog/Novo Rapid		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	301	296		
Units: percentage of HbA1c				
least squares mean (standard error)	-0.38 (± 0.042)	-0.30 (± 0.041)		

## Statistical analyses

<b>Statistical analysis title</b>	SAR341402 Versus NovoLog/NovoRapid
Statistical analysis description:	
Analysis was performed using ANCOVA with treatment group (SAR341402, NovoLog/NovoRapid), the randomisation strata of geographical region, type of diabetes and prior use of NovoLog/NovoRapid as fixed categorical effects, as well as the continuous fixed covariate of baseline HbA1c value.	
Comparison groups	SAR341402 v NovoLog/NovoRapid
Number of subjects included in analysis	597
Analysis specification	Pre-specified
Analysis type	non-inferiority <sup>[1]</sup>
Parameter estimate	LS Mean difference
Point estimate	-0.08
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.192
upper limit	0.039
Variability estimate	Standard error of the mean
Dispersion value	0.059

Notes:

[1] - Non-inferiority of SAR341402 over NovoLog/NovoRapid was demonstrated if upper bound of the 2-sided 95% confidence interval (CI) of the difference between SAR341402 and NovoLog/NovoRapid was <0.3%. If non-inferiority was demonstrated, using a hierarchical step down testing procedure, the inverse non-inferiority of NovoLog/NovoRapid over SAR341402 was tested and was demonstrated if lower bound of the 2-sided 95% CI of the difference between SAR341402 and NovoLog/NovoRapid was > -0.3%.

## Secondary: Change in HbA1c From Baseline to Week 52

<b>End point title</b>	Change in HbA1c From Baseline to Week 52
End point description:	
All values up to Week 52 were taken into account in the analysis, regardless of adherence to treatment. Change in HbA1c was calculated by subtracting baseline value from Week 52 value. Missing changes at Week 52 were imputed using a retrieved dropout multiple imputation method (separately for subjects who prematurely discontinued or completed treatment). Adjusted LS means and SE were obtained using ANCOVA model on data obtained from the multiple imputations (results were combined using Rubin's formulae). Analysis was performed on ITT population.

### Secondary: Change in the Mean 24-hour Plasma Glucose (PG) Concentration From Baseline to Week 26 and Week 52

End point title	Change in the Mean 24-hour Plasma Glucose (PG) Concentration From Baseline to Week 26 and Week 52
-----------------	---

End point description:

Mean 24-hour PG concentration was calculated by 7-point self-measured plasma glucose (SMPG) profiles with PG measurements before and 2-hours after each main meal and at bedtime. Mean 24-hour PG concentration was calculated for each profile and then averaged across profiles performed in week before a visit. All calculated values up to Week 26 and Week 52 were taken for analysis, regardless of adherence to treatment. Change in mean 24-hour PG concentration was calculated by subtracting baseline value from Week 26 and Week 52 values. Missing changes at Week 26 and Week 52 were imputed using return-to-baseline multiple imputation method (values imputed as subject baseline plus an error). Adjusted LS means and SE were obtained using ANCOVA analysis on data obtained from multiple imputations (results were combined using Rubin's formulae). Analysis was performed on ITT population. Here, 'number of subjects analysed' = subjects with a baseline for this end point.

### Secondary: Change in Postprandial Plasma Glucose (PPG) Excursion From Baseline to Week 26 and Week 52

End point title	Change in Postprandial Plasma Glucose (PPG) Excursion From Baseline to Week 26 and Week 52
-----------------	--

End point description:

Plasma glucose excursions were calculated at breakfast, lunch and dinner for each 7-point SMPG profile, as 2-hour PPG minus plasma glucose value obtained 30 minutes prior to start of meal. Values of PPG excursions at each visit were then calculated as average across profiles performed in week before visit. All calculated values up to Week 26 and Week 52 were taken into account in the analysis, regardless of adherence to treatment. Change in PPG excursions at Weeks 26 and 52 was calculated by subtracting baseline value from Week 26 and Week 52 values, respectively. Missing changes at Week 26 and Week 52 were imputed using a return-to-baseline multiple imputation method (values imputed as subject baseline plus an error). Adjusted LS means and SE were obtained using ANCOVA analysis on data obtained from the multiple imputations (results were combined using Rubin's formulae). Analysis was performed on ITT population. End point title	Change in Glycated Hemoglobin A1c From Baseline to Week 26 and Week 52: Subgroup Analysis by Prior Use of NovoLog/NovoRapid or Humalog/Liprolog
-----------------	---

End point description:

All values up to Week 26 and Week 52 were taken into account in the analysis, regardless of adherence to treatment. Change in HbA1c at Week 26 and Week 52 was calculated by subtracting baseline value from Week 26 and Week 52 value, respectively. Missing changes at Week 26 and Week 52 were imputed using a retrieved dropout multiple imputation method (separately for subjects who prematurely discontinued or completed treatment). Adjusted LS means and SE were obtained using ANCOVA model on data obtained from the multiple imputations (results were combined using Rubin's formulae). Analysis was performed on ITT population and data was summarised separately for each treatment arm in each subgroup (based on the prior use of NovoLog/NovoRapid or Humalog/Liprolog).

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AEs) weeks were collected from signature of the informed consent form up to the study completion (up to 52 Weeks) regardless of seriousness or relationship to investigational product.

Adverse event reporting additional description:

Reported AEs and deaths are treatment-emergent AEs, that is AEs that developed/worsened or became serious and deaths that occurred during the '12-month on-treatment period' (time from the first injection of IMP to 1 day after the last injection of IMP). Analysis was performed on safety population.

Assessment type	Systematic

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
31 October 2017	Following changes were made: Change to the inclusion/exclusion criteria; Clarified criteria for permanent treatment discontinuation; Clarified frequency of SMPG to assist insulin titration after reaching target ranges for plasma glucose; Simplified hypoglycemia events analysis by the time of the day; Changes in planned presentation of subject disposition and in time periods of interest for extent of investigational medicinal product exposure; Removal of analysis of hypoglycemia events by treatment period. Inserted "approximately" throughout the document for number of subjects.
13 December 2017	Following changes were made: Inclusion of additional exploratory statistical analyses of AIAs; Increase of the number of subjects.

Notes:

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported

---
