Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	04 September 2019
Is this the analysis of the primary completion data?	Yes
Primary completion date	04 September 2019
Global end of trial reached?	Yes
Global end of trial date	04 September 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The purpose of this trial is to evaluate the safety of sugammadex for the reversal of neuromuscular blockade (NMB) induced by neuromuscular blockade agents (NMBA) rocuronium or vecuronium in adult American Society of Anesthesiologists (ASA) Physical Status Class 3 and 4 participants. The primary objectives of the study are to characterize the incidence of treatment emergent sinus bradycardia, treatment emergent sinus tachycardia, or other treatment emergent cardiac arrhythmias after administration of sugammadex and to evaluate the general safety of sugammadex in a population of ASA Class 3 and 4 participants in a surgical setting

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	20 December 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Austria: 52
Country: Number of subjects enrolled	Denmark: 38
Country: Number of subjects enrolled	Germany: 114
Country: Number of subjects enrolled	United States: 140
Worldwide total number of subjects	344
EEA total number of subjects	204

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0

Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	112
From 65 to 84 years	218
85 years and over	14

Subject disposition

Recruitment

Recruitment details:

Male and female participants with a body mass index (BMI) of <40 kg/m², of American Society of Anesthesiologists (ASA) Class 3 or 4, and a planned surgical procedure requiring Neuromuscular Blockade (NMB) with either rocuronium or vecuronium were recruited.

Pre-assignment

Screening details:

Of 344 participants randomized to the study, 331 received at least one dose of study treatment (All Treated Population) and were evaluable for all safety analysis.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Sugammadex 2 mg/kg

Arm description:

Sugammadex 2 mg/kg administered as a single intravenous (IV) dose

Arm type	Experimental
Investigational medicinal product name	Sugammadex
Investigational medicinal product code	
Other name	MK-8616, Bridion
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous bolus use

Dosage and administration details:

Following administration of NMBA (Rocuronium or Vecuronium) to achieve moderate NMB, participants received a single i.v. bolus of Sugammadex 2 mg/kg for reversal of moderate NMB. Moderate block is a level of NMB in which peripheral nerve stimulation elicits one to four muscle twitches.

Investigational medicinal product name	Vecuronium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

To achieve NMB, participants received steroidal NMBA Vecuronium Bromide administered via IV infusion and dosed according to participant body weight. NMBAs were concomitant medications used per label and at Investigator's discretion as an adjunct to general anesthesia.

Investigational medicinal product name	Rocuronium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

To achieve NMB, participants received steroidal NMBA Rocuronium Bromide administered via IV infusion and dosed according to participant body weight. NMBAs were concomitant medications used per label and at Investigator's discretion as an adjunct to general anesthesia.

Arm title	Sugammadex 4 mg/kg
------------------	--------------------

Arm description:	
Sugammadex 4 mg/kg administered as a single IV dose	
Arm type	Experimental
Investigational medicinal product name	Sugammadex
Investigational medicinal product code	
Other name	MK-8616, Bridion
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous bolus use

Dosage and administration details:

Following administration of NMBA (Rocuronium or Vecuronium) to achieve deep NMB, participants received a single i.v. bolus of Sugammadex 4 mg/kg for reversal of deep NMB. Deep block is a level of NMB in which peripheral nerve stimulation elicits no muscle twitches and high-frequency muscle stimulation elicits minimal levels of muscle contraction.

Investigational medicinal product name	Rocuronium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

To achieve NMB, participants received steroidal NMBA Rocuronium Bromide administered via IV infusion and dosed according to participant body weight. NMBAs were concomitant medications used per label and at Investigator's discretion as an adjunct to general anesthesia.

Investigational medicinal product name	Vecuronium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

To achieve NMB, participants received steroidal NMBA Vecuronium Bromide administered via IV infusion and dosed according to participant body weight. NMBAs were concomitant medications used per label and at Investigator's discretion as an adjunct to general anesthesia.

Arm title	Sugammadex 16 mg/kg
------------------	---------------------

Arm description:

Sugammadex 16 mg/kg administered as a single IV dose

Arm type	Experimental
Investigational medicinal product name	Sugammadex
Investigational medicinal product code	
Other name	MK-8616, Bridion
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous bolus use

Dosage and administration details:

Following administration of NMBA (Rocuronium) to achieve deep NMB, participants received a single i.v. bolus of Sugammadex 16 mg/kg for reversal of deep NMB. Deep block is a level of NMB in which peripheral nerve stimulation elicits no muscle twitches and high-frequency muscle stimulation elicits minimal levels of muscle contraction.

Investigational medicinal product name	Rocuronium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

To achieve NMB, participants received steroidal NMBA Rocuronium Bromide administered via IV infusion and dosed according to participant body weight. NMBAs were concomitant medications used per label and at Investigator's discretion as an adjunct to general anesthesia.

Arm title	Neostigmine + Glycopyrrolate
------------------	------------------------------

Arm description:

Neostigmine 50 µg/kg (up to 5 mg maximum dose) plus glycopyrrolate 10 µg/kg (up to 1 mg maximum dose) administered as a single IV dose

Arm type	Active comparator
Investigational medicinal product name	Neostigmine + Glycopyrrolate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous bolus use

Dosage and administration details:

Following administration of NMBA (Rocuronium or Vecuronium) to achieve moderate NMB, participants received a single i.v. bolus of Neostigmine (50 µg/kg; 5 mg maximum) and Glycopyrrolate (10 µg/kg; 1 mg maximum) for reversal of moderate NMB. Moderate block is a level of NMB in which peripheral nerve stimulation elicits one to four muscle twitches.

Investigational medicinal product name	Vecuronium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

To achieve NMB, participants received steroidal NMBA Vecuronium Bromide administered via IV infusion and dosed according to participant body weight. NMBAs were concomitant medications used per label and at Investigator's discretion as an adjunct to general anesthesia.

Investigational medicinal product name	Rocuronium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

To achieve NMB, participants received steroidal NMBA Rocuronium Bromide administered via IV infusion and dosed according to participant body weight. NMBAs were concomitant medications used per label and at Investigator's discretion as an adjunct to general anesthesia.

Primary: Percentage of Participants With Treatment-Emergent Sinus Bradycardia Events

End point title	Percentage of Participants With Treatment-Emergent Sinus Bradycardia Events
End point description: The percentage of participants experiencing treatment-emergent sinus bradycardia events was identified with continuous electrocardiogram (ECG) monitoring. Treatment-emergent sinus bradycardia defined as a heart rate <60 beats per minute (bpm) that has also decreased more than 20% compared to participant baseline heart rate value, sustained for at least 1 minute after administration of study intervention. Treatment-emergent sinus bradycardia events may or may not have been considered an adverse event (AE), as determined by investigator judgment. All randomized participants who received at least one dose of study intervention were analyzed.

Primary: Percentage of Participants Experiencing an Adverse Event (AE) Up To 7 Days After Administration of Study Intervention

End point title	Percentage of Participants Experiencing an Adverse Event (AE) Up To 7 Days After Administration of Study Intervention
-----------------	---

End point description:

As per the protocol primary analysis, the percentage of participants experiencing an AE up to 7 days after administration of study intervention was reported. An AE was defined as any untoward medical occurrence in a participant which did not necessarily have a causal relationship with this treatment. An AE could therefore be any unfavourable and unintended sign, symptom, or disease temporally associated with the use of a medicinal product or protocol-specified procedure, whether or not considered related to the medicinal product or protocol-specified procedure. Any worsening (i.e., any clinically significant adverse change in frequency and/or intensity) of a pre-existing condition that was temporally associated with the use of the Sponsor's product was also an AE. All randomized participants who received at least one dose of study intervention were analyzed.

Primary: Percentage of Participants Experiencing an Event of Clinical Interest (ECI)

Up To 7 Days After Administration of Study Intervention

End point title	Percentage of Participants Experiencing an Event of Clinical Interest (ECI) Up To 7 Days After Administration of Study Intervention
-----------------	---

End point description:

As per the protocol primary analysis, the percentage of participants experiencing an ECI up to 7 days after administration of study intervention was reported. ECIs were a discrete set of both AEs and SAEs, specifically designated as such for the trial. For the purposes of this investigation, ECIs included 1) drug-induced liver injury; 2) clinically-relevant arrhythmias, inclusive of bradycardia and tachycardia defined as events necessitating intervention, as determined by investigator judgment; and 3) instances of hypersensitivity and/or anaphylaxis adjudicated by an external expert Adjudication Committee. All randomized participants who received at least one dose of study intervention were analyzed. A participant could have experienced more than one type of ECI.

End point type	Primary
----------------	---------

End point timeframe:

Up to 7 days

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Up to approximately 21 days.

Adverse event reporting additional description:

All-Cause Mortality reported for all randomized participants (N = 344: Sugammadex 2 mg/kg: n = 111, Sugammadex 4 mg/kg: n = 112, Sugammadex 16 mg/kg: n = 68, and Neostigmine + Glycopyrrolate: n = 53). Serious AEs and Other AEs were reported for all randomized participants who received at least 1 dose of study treatment.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
13 July 2018	The major change in amendment 1 was to provide flexibility to trial sites.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
