

## Clinical trial results:

### Phase 2 Study of Carboplatin, Etoposide, and Atezolizumab With or Without Trilaciclib (G1T28) in Patients with Untreated Extensive-Stage Small Cell Lung Cancer

#### Summary

EudraCT number	2017-000358-20
Trial protocol	EE LV BG ES FR
Global end of trial date	29 October 2020

#### Results information

Result version number	v1 (current)
This version publication date	14 November 2021
First version publication date	14 November 2021
Summary attachment (see zip file)	G1T28-05_CSR Synopsis (Synopsis G1T28-05_Clinical_Study_Report_v1.0_30_Mar_2020.docx (002).pdf)

#### Trial information

##### Trial identification

Sponsor protocol code	G1T28-05
-----------------------	----------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT03041311
WHO universal trial number (UTN)	-

Notes:

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 December 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	17 August 2018
Global end of trial reached?	Yes
Global end of trial date	29 October 2020
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To evaluate the potential of trilaciclib, compared with placebo, to reduce chemotherapy-induced myelosuppression in patients with small cell lung cancer (SCLC) undergoing treatment with etoposide, carboplatin, and atezolizumab

Protection of trial subjects:

This study is being conducted in full conformance with the principles of the Declaration of Helsinki (as amended in Tokyo, Venice, Hong Kong, and South Africa) or with the laws and regulations of the country in which the research was conducted, whichever afforded the greater protection to the individual. The investigator ensured adherence to the basic principles of Good Clinical Practice (GCP), as outlined in the current version of 21 Code of Federal Regulations, Part 312, Subpart D (Responsibilities of Sponsors and Investigators), Part 50 (Protection of Human Subjects), Part 54 (Financial Disclosure by Clinical Investigators), and Part 56 (IRBs), and International Council for Harmonisation (ICH) E6 GCP. The investigator followed all national, state, and local laws of the pertinent regulatory authorities.

Written informed consent was obtained from each patient participating in this study, after adequate explanation of the goals, methods, potential benefits, and hazards of the study.

An external data monitoring committee (DMC) was used to evaluate safety of the study in an ongoing manner. The DMC performed an initial review after approximately 12 patients were enrolled and completed at least 1 cycle to assess the initial safety data from the 2 groups; subsequent reviews were completed approximately every 4 months depending on the enrollment rate. Additional reviews could occur based on DMC requests. At no time did the DMC indicate that the study needed to be modified or stopped.

Background therapy:

The combination of etoposide and carboplatin is a standard SCLC treatment and, at the time of protocol initiation, was under investigation with atezolizumab for the treatment of SCLC. Atezolizumab (Tecentriq®) is a monoclonal antibody that binds to programmed death-ligand 1 (PD-L1), inhibiting its interaction with the programmed cell death protein 1 (PD-1) receptor and releasing the PD-L1/PD-1-mediated inhibition of the immune response. On March 18, 2019, the Food and Drug Administration approved atezolizumab (TECENTRIQ, Genentech Inc.) in combination with carboplatin and etoposide, for the first-line treatment of adult patients with extensive-stage SCLC. All patients in this study underwent treatment with etoposide, carboplatin, and atezolizumab.

Evidence for comparator: -

Actual start date of recruitment	29 June 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	United States: 42
Country: Number of subjects enrolled	Georgia: 16

Country: Number of subjects enrolled	Ukraine: 19
Country: Number of subjects enrolled	Spain: 4
Country: Number of subjects enrolled	Bulgaria: 13
Country: Number of subjects enrolled	Estonia: 5
Country: Number of subjects enrolled	France: 2
Country: Number of subjects enrolled	Latvia: 6
Worldwide total number of subjects	107
EEA total number of subjects	30

Notes:

---

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	54
From 65 to 84 years	53
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

A total of 37 sites enrolled patients in the United States, Spain, France, Bulgaria, Estonia, Latvia, Ukraine, and Georgia.

### Pre-assignment

Screening details:

A total of 125 patients were enrolled in this study; 18 were reported as screen failures (15 failed to meet the eligibility criteria, 2 withdrew consent, and 1 had the Screening Phase expire and was later rescreened). Thus, 107 patients were randomized to a treatment group. However, 2 patients were randomized in error and received no study drug.

### Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer

Blinding implementation details:

Because the active drug product trilaciclib has a faint yellow color when reconstituted and diluted, an unblinded pharmacist/designee and unblinded infusion nurse were identified to prepare the drug and the infusion sets that included placement of an amber bag over the infusion bag and amber sleeves to cover the IV tubing to hide the color of the infusate. This infusion apparatus was handed off to the blinded infusion nurse for administration.

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Trilaciclib

Arm description:

Induction Period: Patients received trilaciclib 240 mg/m<sup>2</sup> administered intravenously (IV) once daily prior to chemotherapy on Days 1 to 3 of each 21-day therapy cycle (up to 4 cycles in total). Etoposide 100 mg/m<sup>2</sup> was administered as an IV infusion over 60 minutes on Days 1, 2, and 3 of each 21-day cycle. The carboplatin dose was to be calculated using the Calvert formula with a target AUC of 5 mg·min/mL (maximum 750 mg) IV over approximately 30 minutes on Day 1 of each 21-day cycle. Atezolizumab 1200 mg was administered as an IV infusion on Day 1 of each 21-day cycle. Maintenance Period: Patients received atezolizumab monotherapy once every 21 days.

Arm type	Experimental
Investigational medicinal product name	Trilaciclib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

240 mg/m<sup>2</sup> administered IV once daily on Days 1 to 3 of each 21-day therapy cycle during the Induction Period

<b>Arm title</b>	Placebo
------------------	---------

Arm description:

Induction Period: Patients received placebo administered IV once daily prior to chemotherapy on Days 1 to 3 of each 21-day therapy cycle (up to 4 cycles in total). Etoposide 100 mg/m<sup>2</sup> was administered as an IV infusion over 60 minutes on Days 1, 2, and 3 of each 21-day cycle. The carboplatin dose was to be calculated using the Calvert formula with a target AUC of 5 mg·min/mL (maximum 750 mg) IV over approximately 30 minutes on Day 1 of each 21-day cycle. Atezolizumab 1200 mg was administered as an IV infusion on Day 1 of each 21-day cycle. Maintenance Period: Patients received atezolizumab monotherapy once every 21 days.

Arm type	Placebo
----------	---------

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

250 mL of dextrose 5% in water or sodium chloride solution 0.9% administered IV once daily on Days 1 to 3 of each 21-day therapy cycle during the Induction Period

<b>Number of subjects in period 1</b>	Trilaciclib	Placebo
Started	54	53
Completed	0	0
Not completed	54	53
Consent withdrawn by subject	8	5
Death	39	42
Progressive disease	3	1
Lost to follow-up	-	1
Randomized in error; did not receive drug	2	-
Sponsor terminated study	2	4

### Primary: Co-primary Endpoint: Duration of severe (Grade 4) neutropenia in Cycle 1

End point title	Co-primary Endpoint: Duration of severe (Grade 4) neutropenia in Cycle 1
-----------------	--

End point description:

Duration of severe neutropenia (DSN; days) was defined as the number of days from the date of the first absolute neutrophil count (ANC) value of  $<0.5 \times 10^9/L$  observed between start of cycle and end of cycle to the date of the first ANC value  $\geq 0.5 \times 10^9/L$  that met the following criteria: (1) occurred after the ANC value of  $<0.5 \times 10^9/L$  and (2) no other ANC values  $<0.5 \times 10^9/L$  occurred between this day and end of cycle. DSN was set to 0 for patients who did not experience severe neutropenia in a cycle, including those that were randomized and not treated. Data from unscheduled visits and the actual assessment date (rather than visit date) were included in the derivation. This endpoint was analyzed using the intent-to-treat (ITT) analysis set, which included all randomized patients.

End point type	Primary
----------------	---------

End point timeframe:

Evaluated for Cycle 1 of the Induction Period (i.e., from the date of randomization to the end of Cycle 1). Results presented are based on data collected through Database Lock 1 (17 Aug 2018).

End point values	Trilaciclib	Placebo		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	54	53		
Units: days				
arithmetic mean (standard deviation)	0 ( $\pm$ 1.0)	4 ( $\pm$ 4.7)		

## Statistical analyses

<b>Statistical analysis title</b>	Duration of severe neutropenia in Cycle 1
Statistical analysis description:	
Treatment difference was evaluated using a nonparametric analysis of covariance (ANCOVA). The nonparametric ANCOVA included study baseline ANC value as covariate, stratification factors of ECOG performance status (0 to 1 versus 2) and brain metastases (Yes versus No), and treatment as a fixed effect.	
Comparison groups	Trilaciclib v Placebo
Number of subjects included in analysis	107
Analysis specification	Pre-specified
Analysis type	superiority
P-value	< 0.0001 <sup>[1]</sup>
Method	Nonparametric ANCOVA
Parameter estimate	Mean difference (net)
Point estimate	-3.6
Confidence interval	
level	95 %
sides	2-sided
lower limit	-4.9
upper limit	-2.3
Variability estimate	Standard error of the mean
Dispersion value	0.65

Notes:

[1] - A Hochberg-based gatekeeping procedure was used to control the global familywise error rate across the multiple null hypotheses (for 2 primary and 8 secondary myelosuppression endpoints) in a strong sense at a 1-sided 0.025 level.

### Primary: Co-primary Endpoint: Occurrence of severe (Grade 4) neutropenia

End point title	Co-primary Endpoint: Occurrence of severe (Grade 4) neutropenia
-----------------	---

End point description:

The occurrence of severe (Grade 4) neutropenia (SN) was a binary variable. If a patient had at least 1 absolute neutrophil count value  $<0.5 \times 10^9/L$  during the Induction Period, the patient was assigned as Yes to the occurrence of SN; otherwise, it was No. This endpoint was analyzed using the intent-to-treat (ITT) analysis set, which included all randomized patients.

End point type	Primary
----------------	---------

End point timeframe:

Evaluated for the Induction Period (i.e., from the date of randomization to the end of the last Induction cycle). Results presented are based on data collected through Database Lock 1 (17 August 2018).

End point values	Trilaciclib	Placebo		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	54 <sup>[2]</sup>	53 <sup>[3]</sup>		
Units: Patients with severe neutropenia	1	26		

Notes:

[2] - Percentage with severe neutropenia: 1.9%

[3] - Percentage with severe neutropenia: 49.1%

### Statistical analyses

<b>Statistical analysis title</b>	Occurrence of severe neutropenia
-----------------------------------	----------------------------------

**Statistical analysis description:**

Treatment group difference was analyzed using a modified Poisson regression model to account for the variable duration of the Induction Period for each patient. The model included baseline absolute neutrophil count as a covariate, the stratification factors of ECOG performance status (0 to 1 versus 2) and brain metastases (Yes versus No), and treatment as a fixed effect. The logarithm transformation of number of Induction cycles was included as an offset variable in the modeling.

Comparison groups	Trilaciclib v Placebo
Number of subjects included in analysis	107
Analysis specification	Pre-specified
Analysis type	superiority
P-value	< 0.0001 <sup>[4]</sup>
Method	Modified Poisson regression
Parameter estimate	Adjusted rate ratio
Point estimate	0.038
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.008
upper limit	0.195
Variability estimate	Standard error of the mean
Dispersion value	0.0319

**Notes:**

[4] - A Hochberg-based gatekeeping procedure was used to control the global familywise error rate across the multiple null hypotheses (for 2 primary and 8 secondary myelosuppression endpoints) in a strong sense at a 1-sided 0.025 level.

**Secondary: Key Secondary Endpoint: Occurrence of red blood cell transfusions on/after Week 5 (proportion of patients)**

End point title	Key Secondary Endpoint: Occurrence of red blood cell transfusions on/after Week 5 (proportion of patients)
-----------------	--

**End point description:**

For this endpoint, the occurrence during the Induction Period was defined as a binary variable (Yes or No); Yes, if total number of events  $\geq 1$  was observed, No for other scenarios. If a patient did not have an event, a value of 0 was assigned to that patient. Each red blood cell transfusion with a unique start date on/after Week 5 on study during the Induction was defined as a separate event.

End point type	Secondary
----------------	-----------

**End point timeframe:**

Evaluated for the Induction Period starting at Week 5. Results presented are based on data collected through Database Lock 1 (17 August 2018).

End point values	Trilaciclib	Placebo		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	54 <sup>[5]</sup>	53 <sup>[6]</sup>		
Units: Patients with transfusion on/after Wk 5	7	11		

**Notes:**

[5] - Percentage with red blood cell transfusion on/after Week 5: 13.0%

[6] - Percentage with red blood cell transfusion on/after Week 5: 20.8%

**Statistical analyses**

<b>Statistical analysis title</b>	Occurrence of RBC transfusion on/after Week 5

## Secondary: Best Overall Response

End point title	Best Overall Response
-----------------	-----------------------

End point description:

For all patients, the RECIST v1.1 tumor response data were used to determine each patient's visit response (TPR = time point response) according to RECIST v1.1 and the best overall response (BOR). The TPR at each visit was determined in 2 ways: (1) derived programmatically at the time of analysis using the information from target lesions, non-target lesions, and new lesions based on data collected through eCRF; and (2) judged by the investigator as collected in the eCRF. Results shown here are from the programmatically derived assessments.

End point type	Secondary
End point timeframe:	
Evaluated for the full Treatment Phase (Induction and Maintenance Periods). Results presented are based on data collected through Database Lock 2 (28 June 2019).

## Secondary: Duration of objective response (complete response or partial response)

End point title	Duration of objective response (complete response or partial response)
End point description:	
Duration of Response (DOR) is the time between first response by RECIST Version 1.1 of CR or PR and the first date that progressive disease is documented by RECIST Version 1.1, or death. Patients who do not experience PD or death will be censored at the last tumor assessment date. Only those patients with confirmed responses will be included in this analysis.	
End point type	Secondary
End point timeframe:	
Evaluated for the full Treatment Phase (Induction Period and Maintenance Period). Results presented are based on data collected through Database Lock 2 (28 June 2019).	

End point values	Trilaciclib	Placebo		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	28	33		
Units: Months				
number (confidence interval 95%)				
25%	4.4 (2.9 to 4.7)	3.0 (2.7 to 4.1)		
Median	5.6 (4.4 to 7.0)	4.3 (3.4 to 4.7)		
75%	8.3 (5.8 to 13.2)	5.0 (4.6 to 10.5)

### Secondary: Progression-free survival

End point title	Progression-free survival
-----------------	---------------------------

End point description:

Progression-free survival (PFS) was defined as the time (number of months) from date of randomization until date of documented radiologic disease progression per RECIST v1.1 or death due to any cause, whichever came first.

End point type	Secondary
----------------	-----------

End point timeframe:

Evaluated for the full Treatment Phase (Induction and Maintenance Periods). Results presented are based on data collected through Database Lock 2 (28 June 2019).

End point values	Trilaciclib	Placebo		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	54 <sup>[12]</sup>	53 <sup>[13]</sup>		
Units: Months				
number (confidence interval 95%)				
25%	3.7 (2.7 to 4.2)	4.0 (3.1 to 4.3)		
Median	5.9 (4.2 to 7.1)	5.4 (4.3 to 5.7)		
75%	8.5 (7.1 to 10.4)	6.4 (5.7 to 8.9)		

Notes:

[12] - (death without progressive disease: n=6, disease progression: n=42, censored: n=6)

[13] - (death without progressive disease: n=6, disease progression: n=43, censored: n=4)

## Statistical analyses

No statistical analyses for this end point

### Secondary: Overall survival

End point title	Overall survival
-----------------	------------------

End point description:

Overall survival was calculated as the time (months) from date of randomization to the date of death due to any cause. Patients who did not die during the study were censored at the date last known to be alive. Patients lacking data beyond the date of randomization had their survival time censored at date of randomization. Overall survival was not censored if a patient received other anti-tumor treatments after the study drugs. Overall survival was calculated using the Kaplan-Meier method.

End point type	Secondary
----------------	-----------

End point timeframe:

Evaluated for the full duration of the study (i.e., from randomization through the Survival Follow-up Phase). Results presented are based on data collected through Final Database Lock (11 December 2020).

End point values	Trilaciclib	Placebo

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Treatment-emergent adverse events collected through 30 days after last dose of study drug. Treatment-emergent serious adverse events collected through 90 days after last dose of study drug. Results presented are based on Final Database Lock (11 Dec 2020).

Adverse event reporting additional description:

Adverse events were assessed using the safety analysis set, which included all randomized patients who received at least 1 dose of any study drug (etoposide, carboplatin, atezolizumab, or trilaciclib). Analyses using the safety analysis set were conducted based on the actual treatment received.

Assessment type	Systematic
-----------------	------------

### Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	23.1
--------------------	------

### Reporting groups

Reporting group title	Trilaciclib
-----------------------	-------------

Reporting group description:

Induction Period: Patients received trilaciclib 240 mg/m<sup>2</sup> administered IV once daily on Days 1 to 3 of each 21-day therapy cycle (up to 4 cycles in total). Etoposide 100 mg/m<sup>2</sup> was administered as an IV infusion over 60 minutes on Days 1, 2, and 3 of each 21-day cycle. The carboplatin dose was to be calculated using the Calvert formula with a target AUC of 5 mg·min/mL (maximum 750 mg) IV over approximately 30 minutes on Day 1, and 100 mg/m<sup>2</sup> etoposide was administered IV over approximately 60 minutes daily on Days 1, 2, and 3 of each 21-day cycle. Atezolizumab 1200 mg was administered as an IV infusion on Day 1 of each 21-day cycle.

Maintenance Period: Patients received atezolizumab monotherapy once every 21 days.

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Induction Period: Patients received placebo administered IV once daily on Days 1 to 3 of each 21-day therapy cycle (up to 4 cycles in total). Etoposide 100 mg/m<sup>2</sup> was administered as an IV infusion over 60 minutes on Days 1, 2, and 3 of each 21-day cycle. ## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 May 2017	<ul style="list-style-type: none"><li>• An additional risk (hypophysitis) with atezolizumab was added.</li><li>• Assessments to be made after the last dose of study drug were changed from 30 and 120 days after the last dose to 30 and 90 days after the last dose.</li><li>• Specification was added that the weight used for calculation of glomerular filtration rate using the Cockcroft-Gault equation should be the actual body weight (and not ideal body weight).</li><li>• It was clarified that concomitant medications like bisphosphonates and denosumab, which are used to prevent skeletal-related events in patients with bony metastases, are allowed as long as the patient has been on stable doses for at least 4 weeks.</li><li>• An allowance was added that such that the timing and number of samples collected for pharmacokinetic, immunologic markers and anti-atezolizumab antibody testing can be altered based on emerging data without requiring an amendment if the blood volume/day or overall does not increase and the patient is not required to have additional clinic visits or prolongation of a clinic visit, ie, the risk-benefit profile for the patient does not worsen. Specification was added that the investigators and institutional review boards (IRBs) or Independent Ethics Committees (IECs) will be notified if the frequency is reduced.</li><li>• A provision was added that any ECG with a QTc value of &gt; 500 should be repeated every 5 minutes for a total of 3 ECGs to confirm this finding, and that the QTc value should also be confirmed via manual read.</li><li>• Clarifications were made to the secondary objectives and inclusion criteria.</li><li>• Descriptions regarding the timing of vital sign assessments and infusion duration for both trilaciclib and placebo were modified slightly.</li></ul>
14 September 2018	<ul style="list-style-type: none"><li>• Additional rationale describing the mechanism of action of trilaciclib and the potential myelopreservation benefit to patients receiving cytotoxic chemotherapy has been added.</li><li>• Statistics has been updated to further define the modified Primary and Secondary endpoints.</li><li>• Objectives and endpoints were updated to evaluate the potential of trilaciclib to reduce chemotherapy-induced myelosuppression</li><li>• Modification of sample size justification; the sample size calculation is now based on demonstrating the superiority of trilaciclib + E/P/A versus placebo + E/P/A with respect to at least one of the primary efficacy endpoints. No adjustment to the sample size was determined to be needed; therefore, this amendment does not impact patient accrual.</li><li>• Clarification of Final Analysis as well as an End of Study Analysis where the Final Analysis will include the final myelopreservation and ORR analysis and interim PFS and OS, and the End of Study Analysis would be performed when at least 70% of the patients have died. The timing of the Final Analysis was chosen to occur at a time point when all patients will have completed the randomized Induction Period of the study and will have discontinued trilaciclib or placebo treatment.</li><li>• Modification of the planned statistical methods. A composite is proposed as either a Key Secondary endpoint (Region 1) or a supportive secondary endpoint (Region 2). Myelosuppression is an example of a serious disease for which more than one clinical outcome is important, and trilaciclib is expected to elicit an effect on more than one of these clinically relevant endpoints. Therefore, analysis of a composite endpoint presents an opportunity to evaluate multiple aspects of clinically relevant effectiveness in a single analysis.</li><li>• Text describing multiplicity adjustments for the myelosuppression endpoints has been added.</li><li>• Details of the analysis of supportive secondary efficacy endpoints (anti-tumor and myelosuppression) have been added.</li></ul>

Notes:

---

## Interruptions (globally)

Were there any global interruptions to the trial? No

## Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Small sample size may have reduced the ability to observe statistically significant treatment effects on secondary myelopreservation measures (i.e. occurrence of FN AEs, infections and antibiotics usage). Only able to detect large differences in OS.
---
