Notes:

General information about the trial

Main objective of the trial:

This trial will evaluate the safety and pharmacokinetics (PK) of sugammadex for the reversal of both moderate and deep neuromuscular blockade (NMB) induced by either rocuronium (ROC) or vecuronium (VEC) in pediatric participants. The primary efficacy hypothesis of this investigation is that sugammadex is superior to neostigmine in reversing moderate NMB in pediatric participants as measured by time to recovery to a train-of-four (TOF) ratio of ≥ 0.9 .

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Male and female participants 2 to <17 years of age who are categorized as American Society of Anesthesiologists (ASA) Physical Class 1, 2, or 3 and had a planned medical and/or surgical procedure requiring moderate or deep NMB with ROC or VEC that would allow for neuromuscular monitoring were recruited.

Arms

Are arms mutually exclusive?	Yes
Arm title	Part A: Sugammadex 2 mg/kg

Arm description:

For moderate NMB reversal, a single intravenous (i.v.) bolus of sugammadex (2 mg/kg) was given after final dose of neuromuscular blocking agent (NMBA; rocuronium or vecuronium) and within 2 minutes of the reappearance of a second twitch (T2) in response to TOF stimulations.

Arm type	Experimental
Investigational medicinal product name	Sugammadex
Investigational medicinal product code	
Other name	MK-8616 BRIDION
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

For moderate NMB reversal, a single i.v. bolus of sugammadex (2 mg/kg) is given after final dose of neuromuscular blocking agent (NMBA; rocuronium or vecuronium) and within 2 minutes of the reappearance of a second twitch (T2) in response to TOF stimulations.

Arm title	Part A: Sugammadex 4 mg
------------------	-------------------------

Arm description:

For deep NMB reversal, a single i.v. bolus of sugammadex (4 mg/kg) was given after final dose of NMBA (rocuronium or vecuronium) and within 2 minutes of detection of a target of 1 to 2 post-tetanic counts and no response to TOF stimulations (TOF=0).

End point description:

The time to recovery of TOF ratio to ≥ 0.9 after administration of study intervention was determined for each Part B arm. The TOF ratio is the ratio of the magnitude of the fourth (T4) and first (T1) thumb twitches elicited by 4 electrical stimulations of the ulnar nerve, indicating the current degree of NMB as a decimal from 0 (loss of T4 twitch) to 1 (no NMB). Values closer to 1 indicate less NMB. All randomized participants in Part B who received ≥ 1 dose of study drug are included. Per protocol, the efficacy analysis is based on comparison of the Part B: Sugammadex 2 mg arm versus the Part B: Neostigmine + (Glycopyrrolate or Atropine) arm.

End point type	Primary

End point timeframe:

Up to 30 minutes post-dose

Notes:

[8] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Per protocol, only descriptive statistics are presented.

Timeframe for reporting adverse events:

Up to 14 days

Adverse event reporting additional description:

An AE is any untoward medical occurrence in a patient or clinical study participant, temporally associated with the use of study treatment, whether or not considered related to the study treatment. All participants who received ≥ 1 dose of study drug are included.
