## General information about the trial

Main objective of the trial:

The primary objective of this study was to evaluate the efficacy of CSL112 in reducing the risk of Major adverse cardiovascular event (MACE) (cardiovascular [CV] death, myocardial infarction [MI], or stroke) from the time of randomisation through 90 days in subjects with acute coronary syndrome (ACS) (diagnosed with ST-segment elevation myocardial infarction [STEMI] or Non-ST-segment elevation myocardial infarction [NSTEMI]).

Protection of trial subjects:

This study was carried out in accordance with the International Council for Harmonisation (ICH) Good Clinical Practice (GCP) guidelines, the ethical principles that have their origin in the Declaration of Helsinki, all applicable national and local regulations, and standard operating procedures for clinical research and development at CSL Behring (CSL). The study protocol and all amendments were approved by the Independent Ethics Committee (IEC) of the participating center. Before any protocol-specific procedures were carried out, participants were informed, in an understandable form, about the nature, scope, and possible consequences of the study. Participant informed consent was obtained and documented according to the provisions of ICH GCP and applicable regulatory requirements. Written informed consent was provided by each participant before any protocol-specific procedures were carried out.

Clinical laboratory assessments included assessment of Hematology (hemoglobin, hematocrit, leukocytes and platelets) and Biochemistry (alkaline phosphatase [ALP], alanine aminotransferase [ALT], aspartate aminotransferase [AST], bilirubin and estimated glomerular filtration rate [eGFR]). Number of participants with shift from Baseline value to worst post-treatment value (low, normal, or high) was reported. Worst criterion for parameters is as follows: hematocrit - low, hemoglobin - low, leukocytes - high, platelets - low, ALT - high, ALP - high, AST - high, bilirubin - high, direct bilirubin - high, indirect bilirubin - high, eGFR - severe impairment. SAS comprised all participants in ITT Analysis set who received any amount of investigational product, and were analyzed based on actual treatment received. ## Secondary: Percentage of Participants With a Shift From Baseline to Worst Post-treatment Value in Clinical Laboratory Assessments

End point title	Percentage of Participants With a Shift From Baseline to Worst Post-treatment Value in Clinical Laboratory Assessments
-----------------	--

End point description:

Clinical laboratory assessments included assessment of Hematology (hemoglobin, hematocrit, leukocytes and platelets) and Biochemistry (ALP, ALT, AST, bilirubin and eGFR). Percentage of participants with a shift from the Baseline value to the worst post-treatment value (low, normal, or high) was reported. The worst criterion for the parameters is as follows: hematocrit - low, hemoglobin - low, leukocytes - high, platelets - low, ALT - high, ALP - high, AST - high, bilirubin - high, direct bilirubin - high, indirect bilirubin - high, eGFR - severe impairment. Analysis was performed on the SAS. The SAS comprised all participants in the ITT Analysis set who received any amount of the investigational product, and were analyzed based on the actual treatment received. Here, the number of participants analyzed (N), included all participants who were evaluated for this endpoint and "n" included all participants who were evaluated for this endpoint for the specified category.

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
10 September 2019	<p>The list below describes key changes to the Clinical Study Protocol:</p> <ul style="list-style-type: none"><li>• Modified the primary endpoint to include all MI events instead of only type 1 (spontaneous) MI events.</li><li>• In the original protocol (dated 23 January 2018) for Inclusion Criteria 6, participants were required to have at least 1 of the following established risk factors: age <math>\geq</math> 65 years, prior history of MI, diabetes mellitus requiring pharmacotherapy, or peripheral artery disease. Modification of Inclusion Criteria 6 utilized the same risk factors but instead required the presence of diabetes mellitus requiring pharmacotherapy, or 2 or more of the following: age <math>\geq</math> 65 years, prior history of MI, and peripheral artery disease. This modification to Inclusion Criteria 6 was implemented to limit enrollment to participants that were at an even higher risk of an early recurrent cardiovascular event.</li><li>• Included additional secondary and exploratory endpoints.</li><li>• Specified that the 70% interim analysis would not be performed if the expected IDMC review of the interim analysis was less than 2 months prior to the anticipated completion of enrollment.</li><li>• Included the option to limit the number of participants enrolled with a specific index MI type (ie, STEMI or NSTEMI).</li><li>• Added updated nonclinical data as well as clinical data from Study CSL112_1002.</li><li>• Modified wording to provide clarifications and improve protocol compliance.</li></ul>
