Notes:

**Paediatric regulatory details**

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	20 May 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	05 May 2020
Global end of trial reached?	Yes
Global end of trial date	05 May 2020
Was the trial ended prematurely?	Yes

Notes:

## General information about the trial

Main objective of the trial:

The primary objective of this study is to assess the efficacy of riociguat on preoperative PVR in patients with operable CTEPH.

Protection of trial subjects:

Patients were treated at expert centres with many years of experience in the management of CTEPH, and all patients were to receive the recommended gold standard treatment for operable CTEPH, i.e. PEA surgery. As per the protocol, surgery was to be performed by the principal surgeon of the site. Moreover, an unblinded, independent data safety monitoring board periodically reviewed safety data.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	16 August 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 7
Country: Number of subjects enrolled	Germany: 6
Country: Number of subjects enrolled	France: 1
Worldwide total number of subjects	14
EEA total number of subjects	14

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	6
From 65 to 84 years	8

85 years and over	0
-------------------	---

## Subject disposition

### Recruitment

Recruitment details:

Eligible patients were recruited at 3 expert centres for CTEPH in France, Germany and the UK between August 2018 and May 2020.

### Pre-assignment

Screening details:

Patients could undergo a screening period of up to 90 days prior to the baseline visit in order to assess eligibility of patients and to allow for the washout of prohibited medications. A total of 17 patients were screened; of those, 14 were enrolled into the study.

### Period 1

Period 1 title	Randomisation (no drug treatment yet)
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Treatment arm

Arm description:

Patients were randomised to receive riociguat for 90 days prior to surgery

Arm type	Active comparator
Investigational medicinal product name	Riociguat
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Riociguat will be initiated at 1 mg tid. The dosage will be increased by 0.5 mg at 2 week intervals based on tolerability as assessed by systolic blood pressure up to a maximum dose of 2.5 mg tid.

Downtitration to 0.5 mg tid is foreseen for patients with low optimal tolerability.

<b>Arm title</b>	Placebo
------------------	---------

Arm description:

Patients were randomised to receive placebo for 90 days prior to surgery

Arm type	Placebo
Investigational medicinal product name	Matching placebo to riociguat
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo was given tid, mimicking the dosing scheme for riociguat

Number of subjects in period 1	Treatment arm	Placebo
Started	7	7
Completed	7	7

## Period 2

Period 2 title	Treatment period
Is this the baseline period?	Yes <sup>[1]</sup>
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

## Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Treatment arm

Arm description:

Patients received riociguat for 90 days prior to surgery.

Arm type	Active comparator
Investigational medicinal product name	Riociguat
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Riociguat will be initiated at 1 mg tid. The dosage will be increased by 0.5 mg at 2 week intervals based on tolerability as assessed by systolic blood pressure up to a maximum dose of 2.5 mg tid.

Downtitration to 0.5 mg tid is foreseen for patients with low optimal tolerability.

<b>Arm title</b>	Placebo
------------------	---------

Arm description:

Patients received placebo for 90 days prior to surgery.

Arm type	Placebo
Investigational medicinal product name	Matching placebo to riociguat
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo was given tid, mimicking the dosing scheme for riociguat

Notes:

[1] - Period 1 is not the baseline period. It is expected that period 1 will be the baseline period.

Justification: One patient died after randomisation, but before starting study treatment. As per the SAP, baseline characteristics are reported for the ITT population, which is defined as patients having received at least one dose of IMP. Therefore, the patient who died before starting treatment was not included in the analysis of baseline characteristics, and a new period had to be defined to account for this.

<b>Number of subjects in period 2</b> <sup>[2]</sup> <sup>[3]</sup>	Treatment arm	Placebo
Started	7	6
Completed	6	5
Not completed	1	1
Inability to schedule PEA according to protocol	1	1

**Notes:**

[2] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: One patient died after randomisation, but before starting study treatment. As per the SAP, baseline characteristics are reported for the ITT population, which is defined as patients having received at least one dose of IMP. Therefore, the patient who died before starting treatment was not included in the analysis of baseline characteristics; however, he is considered to have enrolled in the trial.

[3] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: One patient in the placebo arm died after randomisation, but before starting study treatment.

**Period 3**

Period 3 title	PEA (no more drug treatment)
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

**Arms**

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Treatment arm

**Arm description:**

Patients had received riociguat for 90 days prior to surgery and underwent PEA surgery during this period

Arm type	Active comparator
Investigational medicinal product name	Riociguat
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

**Dosage and administration details:**

Riociguat will be initiated at 1 mg tid. The dosage will be increased by 0.5 mg at 2 week intervals based on tolerability as assessed by systolic blood pressure up to a maximum dose of 2.5 mg tid.

Downtitration to 0.5 mg tid is foreseen for patients with low optimal tolerability.

<b>Arm title</b>	Placebo
------------------	---------

**Arm description:**

Patients had received placebo for 90 days prior to surgery and underwent PEA surgery during this period

Arm type	Placebo
Investigational medicinal product name	Matching placebo to riociguat
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

---

**Dosage and administration details:**

Placebo was given tid, mimicking the dosing scheme for riociguat

<b>Number of subjects in period 3</b>	Treatment arm	Placebo
Started	6	5
Completed	6	5

---

**Period 4**

Period 4 title	Post-surgery observation
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

**Arms**

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Treatment arm

## Arm description:

Patients had received riociguat for 90 days prior to surgery and had undergone PEA surgery

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

From informed consent until study completion (270-360 days) or early termination

Adverse event reporting additional description:

Events reported are treatment-emergent adverse events, i.e. any event not present before exposure to study drug or any event already present that worsened in either intensity or frequency after exposure to study drug, in patients who actually received any study drug.

Assessment type	Systematic

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The study was terminated after enrolling only 14 out of 88 planned patients due to slow recruitment and further limitations imposed by the COVID-19 pandemic. No firm conclusions can be drawn based on the study data due to the limited sample size.
