Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	27 April 2023
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	27 April 2023
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To describe safety and tolerability during longer-term administration of AR101 and follow-up observation after the last dose of AR101.

Protection of trial subjects:

The study was conducted in conformance with the principles of the Declaration of Helsinki (2013) or with the laws and regulations of the country in which the research was conducted, whichever provided greater protection of the individual. In addition, the study was conducted in accordance with Good Clinical Practice (GCP) and International Council for Harmonisation (ICH) of Technical Requirements for Pharmaceuticals for Human Use guidelines, EU (European Union) Directive 2001/20/EC, EU Directive 2005/28/EC, EU Clinical Trials Regulation (CTR) 536/2014, local applicable legislation including but not limited to the United Kingdom (UK) SI 2004/1031 Medicines for Human Use (Clinical Trials) Regulations 2004 as amended, Council for International Organizations of Medical Sciences International Ethical Guidelines, and national and local regulations and directives as appropriate including the archiving of essential records. The study was conducted under a protocol reviewed and approved by an ethics committee and conducted by scientifically and medically qualified persons.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	02 November 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 96
Country: Number of subjects enrolled	United States: 592
Country: Number of subjects enrolled	France: 18
Country: Number of subjects enrolled	Germany: 48
Country: Number of subjects enrolled	Ireland: 36
Country: Number of subjects enrolled	Italy: 10
Country: Number of subjects enrolled	Netherlands: 3
Country: Number of subjects enrolled	Spain: 31
Country: Number of subjects enrolled	Sweden: 10
Country: Number of subjects enrolled	Canada: 67
Worldwide total number of subjects	911
EEA total number of subjects	156

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	607
Adolescents (12-17 years)	274
Adults (18-64 years)	30
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This Phase 3, open-label study was conducted in participants who participated in a prior AR101 study at 89 investigational sites in 10 countries (Canada, France, Germany, Ireland, Italy, Netherlands, Spain, Sweden, United Kingdom, and the United States).

Pre-assignment

Screening details:

A total of 911 participants were enrolled in this study. After enrolling in ARC008, all participants received or continued initial dose escalation, up-dosing, and maintenance of AR101 at 300 milligrams (mg) per day. OLFC= Open-label food challenge and DBPCFC= Double-blind, placebo-controlled food challenge.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	AR101
-----------	-------

Arm description:

Eligible participants who participated in a prior AR101 study received or continued initial dose escalation, up-dosing, and maintenance of AR101 at 300 mg per day until discontinuation criteria was met (maximum exposure: 4.8 years).

Arm type	Experimental
Investigational medicinal product name	AR101
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, Modified-release granules
Routes of administration	Oral use

Dosage and administration details:

AR101 was administered as pull-apart capsules formulated to contain 0.5, 1, 10, 20, or 100 mg of peanut protein or as foil-laminate sachets containing 300 mg of peanut protein.

Number of subjects in period 1	AR101
Started	911
Safety Population	908
Participants Who Had an OLFC	517
Participants Who Had a DBPCFC	211
Completed	18
Not completed	893
Investigator decision (unrelated to AE)	13
Protocol Violation	2
Coronavirus Disease 2019	1
Unspecified	20

Lost to follow-up	7
Withdrew consent (unrelated to adverse event [AE])	86
Sponsor decision	349
Participants did not have Study Exit Forms	415

Reporting group description: Eligible participants who participated in a prior AR101 study received or continued initial dose escalation, up-dosing, and maintenance of AR101 at 300 mg per day until discontinuation criteria was met (maximum exposure: 4.8 years).	
Subject analysis set title	AR101
Subject analysis set type	Safety analysis
Subject analysis set description: Eligible participants who participated in a prior AR101 study received or continued initial dose escalation, up-dosing, and maintenance of AR101 at 300 mg per day until discontinuation criteria was met (maximum exposure: 4.8 years).	

Primary: Number of Participants With Treatment-emergent Adverse Events (TEAEs) and Treatment-emergent Serious Adverse Events (TESAEs)

End point title	Number of Participants With Treatment-emergent Adverse Events (TEAEs) and Treatment-emergent Serious Adverse Events (TESAEs) ^[1]
End point description: An AE was any untoward medical occurrence in humans, whether or not considered related to the investigational product (IP), that occurred during the conduct of a clinical study. A SAE was any event that resulted in any of the following: death, life-threatening AE, inpatient hospitalization or prolongation of existing hospitalization, persistent or significant incapacity or substantial disruption of the ability to conduct normal life functions, congenital abnormality or birth defect, or important medical event that did not result in one of the above outcomes, but jeopardized the health of the study participant or required medical or surgical intervention to prevent one of the outcomes listed above. TEAEs were defined as those AEs with onset after the first dose of AR101 in ARC008 and no more than 30 days after the last dose of study drug. The safety population consisted of all participants who received AR101 during ARC008.	
End point type	Primary
End point timeframe: From first dose of study drug through 30 days after last dose of study drug, up to 59 months	
Notes: [1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point. Justification: As the endpoint is descriptive in nature, no statistical analysis is provided.	

End point values	AR101

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
19 December 2017	The primary purpose of this amendment was to modify the eligibility criteria to ensure that appropriate participants were enrolled in this follow-on study, remove changes in basophil activation as an objective and endpoint of the study, clarify contraceptive methods, clarify the study duration, and remove the requirement for medical monitor confirmation of participant eligibility.
11 May 2018	The primary purpose of this amendment was to modify exclusion criterion 2 to allow AR101 treated participants who did not successfully consume at least the 300 mg single dose of peanut protein at the exit DBPCFC of an originating study that required a food challenge to enroll in study ARC008, if specified in the originating study. This amendment also clarified additional participants from originating study ARC004 who might be eligible to receive daily dosing with AR101 in treatment pathway 2 of ARC008.
24 July 2018	The primary purpose of this amendment was to accommodate participants who did not complete their AR101 dosing regimen in an eligible originating study. Allowed one additional dosing kit to be dispensed in exceptional circumstances to provide flexibility for participants with scheduling issues who required continued dosing. Removed the requirement for repeat up-dosing to be completed within 26 weeks in treatment pathway 2 to provide flexibility and allowed more time for tolerability so participants could continue treatment. Allowed safety follow-up to continue for participants who discontinued early due to AEs from an eligible originating study.
01 November 2019	The primary purpose of this amendment was to add 2 new treatment pathways (Treatment Pathways 4 and 5) for eligible participants from prior study ARC005 to begin or continue treatment with AR101. This amendment also removed the optional real world peanut challenge, which was introduced to inform participants of their potential risk of allergic reaction from unintended ingestion of peanut-containing foods. Extended the study duration to allow assessment of long-term safety of AR101. Removed the daily diary from treatment pathways 1, 2, and 3 and from safety follow-up after early discontinuation to reduce burden for these participants who already have at least 9 months experience taking AR101. Consolidated the procedures for the end of the study. Added or removed telephone calls or expands the window for telephone calls after study site visits for safety follow-up, feasibility, or participant convenience, as appropriate. Added guidance for safety follow-up for participants diagnosed with EoE. Added an exclusion criterion for participants currently committed to an institution by virtue of an order issued by judicial or administrative authorities per some local requirements. Added total immunoglobulin G4 (IgG4) and IgE to immunology assessments. Added an exploratory objective and endpoint to evaluate changes in asthma or atopic dermatitis in participants from prior study ARC005.
28 May 2020	The primary purpose of this amendment was to provide guidance on changes to study conduct during a pandemic, epidemic, or other emergency not related to the study, when restrictions issued at the country, state, regional, and/or local level prevent the conduct of study site visits and access to study product for an extended period.

22 December 2020	The primary purpose of this amendment was to modify the study design to demonstrate a sustained clinical effect after 5 years total of AR101 treatment including all prior studies, and a 1-year observation period after stopping AR101 treatment per regulatory authority request. The study objectives, endpoints, duration, procedures, and schedules of events were updated in accordance with the study design changes. Removed the optional OLFC at the end of treatment as a DBPCFC was required per study design changes. Added guidance to assess the benefit-risk of continued AR101 treatment when a participant had several AR101-related systemic allergic reactions during maintenance treatment for safety reasons. Reduced time points for Asthma Control Test/Childhood Asthma Control Test, Total Nasal Symptom Score, and Test for Respiratory and Asthma Control in Kids during extended maintenance in all treatment pathways to reduce the burden for participants. Removed the Food Allergy Quality of Life – Parental Burden questionnaire from treatment pathways 1 and 2, as it was not administered in prior AR101 studies and changes from baseline cannot be assessed. Added a window for telephone calls after initial dose-escalation day 2, up-dosing visits, and initial maintenance visits in treatment pathway 5 for feasibility. Expanded the window for telephone call after the OLFC from the next day to within 2 days for feasibility.
------------------	---

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
