Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	06 May 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	06 May 2020
Global end of trial reached?	Yes
Global end of trial date	29 November 2020
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To study the safety and efficacy of IV Taxol combined with repeated pressurized intraperitoneal aerosol therapy (PIPAC) using albumin bound nanoparticle paclitaxel (nab-pac, Abraxane) in a multicentre, multinational phase I/II trial.

Protection of trial subjects:

Ethics review and approval, informed consent. The study followed a time-to-event continual reassessment model (TITE-CRM)

The DMC (Data Safety Monitoring Committee) will, based on independent assessment of trial data as they become available, safeguard patient safety and trial integrity. The DMC will take decisions on trial continuation, protocol adaptation, or discontinuation based on efficacy or futility.

Adverse events will be reported between the first PIPAC and 30 after the last PIPAC procedure. All AEs and SAE's will be recorded in the patient's file and in the CRF. All SAE's will be reported as described below.

Medical events that occur between signing of the Informed Consent and the first intake of trial medication will be documented on the medical and surgical history section and concomitant diseases page of the CRF.

SAE's occurring within a period of 30 days following the last intake of trial medication will also be handled as such if spontaneously reported to the investigator.

All serious adverse events (SAE) and pregnancies occurring during clinical trials must be reported by the local Principal Investigator and local Ethical Committee within 2 working days after becoming aware of the SAE. This reporting is done by using the appropriate SAE form. It is the responsibility of the local Principal Investigator to report the local SAE's to the local EC.

In case the investigator decides the SAE is a SUSAR (Suspected Unexpected Serious Adverse Reaction), Bimetra Clinics will report the SUSAR to the Central EC and the CA within the timelines as defined in national legislation. The National Coordinating Investigator reports the SUSAR to all National Coordinating Investigators.

In case of a life-threatening SUSAR the entire reporting process must be completed within 7 calendar days. In case of a non-life-threatening SUSAR the reporting process must be completed within 15 calendar days.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	16 September 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Denmark: 1
Country: Number of subjects enrolled	Belgium: 19
Worldwide total number of subjects	20
EEA total number of subjects	20

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	15
From 65 to 84 years	5
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Thirty-one patients were assessed for eligibility and signed the informed consent form. Between September 2017 and March 2020, treatment was initiated in 23 eligible patients at Ghent University Hospital (n=22) and at Odense University Hospital (n=1). Twenty of them underwent at least two consecutive PIPAC treatments

Pre-assignment

Screening details:

Inclusion criteria and exclusion criteria

Pre-assignment period milestones

Number of subjects started	20
Number of subjects completed	20

Period 1

Period 1 title	overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Abraxane 35 mg/m ²
------------------	-------------------------------

Arm description:

PIPAC with Abraxane (35 mg/m²) will be administered every 4 weeks for 3 cycles.
PIPAC with Abraxane: Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique. The administered dose will escalate ranging from 35 to 140 mg/m². PIPAC will be performed every 4 weeks for 3 cycles.

Arm type	Experimental
Investigational medicinal product name	abraxane
Investigational medicinal product code	PR1
Other name	Albumin bound nanoparticle paclitaxel
Pharmaceutical forms	Powder for suspension for injection
Routes of administration	Intraperitoneal use

Dosage and administration details:

Abraxane 35 mg/m²

Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique.

Arm title	Abraxane 70 mg/m ²
------------------	-------------------------------

Arm description:

PIPAC with Abraxane (70 mg/m²) will be administered every 4 weeks for 3 cycles.
PIPAC with Abraxane: Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique. The administered dose will escalate ranging from 35 to 140 mg/m². PIPAC will be performed every 4 weeks for 3 cycles.

Arm type	Experimental
Investigational medicinal product name	abraxane
Investigational medicinal product code	PR1
Other name	Albumin bound nanoparticle paclitaxel
Pharmaceutical forms	Powder for suspension for injection
Routes of administration	Intraperitoneal use

Dosage and administration details:

Abraxane 70 mg/m²

Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique.

Arm title	Abraxane 90 mg/m ²
------------------	-------------------------------

Arm description:

PIPAC with Abraxane (90 mg/m²) will be administered every 4 weeks for 3 cycles.

PIPAC with Abraxane: Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique. The administered dose will escalate ranging from 35 to 140 mg/m². PIPAC will be performed every 4 weeks for 3 cycles.

Arm type	Experimental
Investigational medicinal product name	abraxane
Investigational medicinal product code	PR1
Other name	Albumin bound nanoparticle paclitaxel
Pharmaceutical forms	Powder for suspension for injection
Routes of administration	Intraperitoneal use

Dosage and administration details:

Abraxane 90 mg/m²

Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique.

Arm title	Abraxane 112.5 mg/m ²
------------------	----------------------------------

Arm description:

PIPAC with Abraxane (112.5 mg/m²) will be administered every 4 weeks for 3 cycles.

PIPAC with Abraxane: Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique. The administered dose will escalate ranging from 35 to 140 mg/m². PIPAC will be performed every 4 weeks for 3 cycles.

Arm type	Experimental
Investigational medicinal product name	abraxane
Investigational medicinal product code	PR1
Other name	Albumin bound nanoparticle paclitaxel
Pharmaceutical forms	Powder for suspension for injection
Routes of administration	Intraperitoneal use

Dosage and administration details:

Abraxane 112.5 mg/m²

Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique.

Arm title	Abraxane 140 mg/m ²
------------------	--------------------------------

Arm description:

PIPAC with Abraxane (140 mg/m²) will be administered every 4 weeks for 3 cycles.

PIPAC with Abraxane: Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique. The administered dose will escalate ranging from 35 to 140 mg/m². PIPAC will be performed every 4 weeks for 3 cycles.

Arm type	Experimental
Investigational medicinal product name	abraxane
Investigational medicinal product code	PR1
Other name	Albumin bound nanoparticle paclitaxel
Pharmaceutical forms	Powder for suspension for injection
Routes of administration	Intraperitoneal use

Dosage and administration details:

Abraxane 140 mg/m²

Albumin bound nanoparticle paclitaxel (Abraxane) will be administered intraperitoneally using the PIPAC technique.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
03 July 2018	<ul style="list-style-type: none">- The number of patients that will be included in University Hospital Ghent during phase I will be increased to (maximum) 20. Inclusion in the other participating centers (outside Belgium) is difficult, in contrast to the inclusion in University Hospital Ghent. Therefore, a maximum of approximately 20 patients will be included in University Hospital Ghent instead of the first 7 patients foreseen. The exact number will depend on eventual inclusion by the other participating centers.- Patients with breast cancer and upper GI cancer were added to the inclusion criteria. Literature demonstrates effectiveness of systemic administration of Abraxane in these types of tumors.- Patients for whom alternative systemic treatments are still an option were also added to the inclusion criteria. Offering our study only to patients without alternative systemic options (so-called end-of-treatment patients) will make inclusion enormously difficult, as this group of patients will then be in a virtually palliative setting, which means that they have insufficient life expectancy and are also physically too weak to undergo general anesthesia in combination with intraperitoneal administration to undergo. Parallel administration of chemotherapy containing a taxane (paclitaxel or docetaxel) is an exclusion criterion.- Consequently, we also like to change the title to: "Intraperitoneale aerosolvorming van albumine-gestabiliseerde paclitaxel nanopartikels (Abraxane®) voor de behandeling van buikvlieskanker: een fase I/II klinische studie" in Dutch and "Intraperitoneal aerosolisation of albumin-stabilized paclitaxel nanoparticles for peritoneal carcinomatosis – phase I/II study protocol" in English.- In addition, we would like to collect additional plasma samples from patients during phase I, in function of systemic toxicity assessment.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
