#### Paediatric regulatory details

|  |    |
|--|----|
| Is trial part of an agreed paediatric investigation plan (PIP)       | No |
| Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial? | No |
| Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial? | No |

Notes:

## Results analysis stage

|  |               |
|--|---------------|
| Analysis stage                                       | Final         |
| Date of interim/final analysis                       | 11 March 2019 |
| Is this the analysis of the primary completion data? | Yes           |
| Primary completion date                              | 11 March 2019 |
| Global end of trial reached?                         | Yes           |
| Global end of trial date                             | 11 March 2019 |
| Was the trial ended prematurely?                     | No            |

Notes:

## General information about the trial

Main objective of the trial:

To determine the efficacy and safety of omalizumab compared with placebo in adult patients with chronic rhinosinusitis with nasal polyps who have had an inadequate response to standard-of-care treatments.

Protection of trial subjects:

This study was conducted in full conformance with the ICH E6 guideline for Good Clinical Practice and the principles of the Declaration of Helsinki, or the laws and regulations of the country in which the research was conducted, whichever afforded the greater protection to the individual. All study subjects were required to read and sign an informed consent form.

| From 65 to 84 years                      | 25  |
| 85 years and over                        | 0   |

## Subject disposition

### Recruitment

Recruitment details: -

### Pre-assignment

Screening details:

At the first visit of the 5-week screening/run-in period, participants were asked to standardize their nasal corticosteroids to a regimen of mometasone, 200 micrograms twice a day (BID). If intolerant to a BID regimen, then they remained on a stable dosage of mometasone once a day (QD) during the run-in period and throughout the treatment period.

### Period 1

|                              |                                 |
|------------------------------|---------------------------------|
| Period 1 title               | Overall Study (overall period)  |
| Is this the baseline period? | Yes                             |
| Allocation method            | Randomised - controlled         |
| Blinding used                | Double blind                    |
| Roles blinded                | Investigator, Assessor, Subject |

### Arms

|                              |         |
|------------------------------|---------|
| Are arms mutually exclusive? | Yes     |
| <b>Arm title</b>             | Placebo |

Arm description:

Participants received matching placebo as a subcutaneous injection once every 2 weeks or once every 4 weeks. The dose and dosing frequency was determined by serum total IgE level and body weight using the study-drug dosing table. All participants were also treated during the entire study with intranasal corticosteroids (mometasone nasal spray) as background therapy.

|  |                                   |
|--|-----------------------------------|
| Arm type                               | Placebo                           |
| Investigational medicinal product name | Placebo                           |
| Investigational medicinal product code |                                   |
| Other name                             |                                   |
| Pharmaceutical forms                   | Powder for solution for injection |
| Routes of administration               | Subcutaneous use                  |

Dosage and administration details:

Placebo was administered subcutaneously every 2 or 4 weeks by qualified personnel who were not involved with conducting safety or efficacy evaluations using a disposable 25-gauge needle in the deltoid region of the right or left arm. Alternatively, the injections could have been administered in the thigh, if medically significant reasons precluded administration in the deltoid region. Because the solution is slightly viscous, the injection may have taken 5-10 seconds to administer. The dose (mg) and dosing frequency were determined by serum total IgE level (IU/mL) (measured before the start of treatment via central laboratory) and body weight (kg). Assignment of the study drug dose was determined by using the study drug-dosing table. The placebo equivalent of doses of greater than (>) 150 mg were divided among more than one injection site to limit injections to no more than 150 mg per site.

|                  |            |
|------------------|------------|
| <b>Arm title</b> | Omalizumab |
|------------------|------------|

Arm description:

Participants received omalizumab as a subcutaneous injection once every 2 weeks (q2w) or once every 4 weeks (q4w). The dose (from 75 mg up to 600 mg) and dosing frequency (q2w or q4w) was determined by serum total IgE level and body weight using the study-drug dosing table. All participants were also treated during the entire study with intranasal corticosteroids (mometasone nasal spray) as background therapy.

| Nasal Polyp Score (NPS) at Baseline  |       |       |     |
| Total NPS ranges from 0 to 8 (sum of 0-4 for left and right nasal passage scores per the following criteria), with a lower score indicating smaller-sized nasal polyps: 0 = No polyps; 1 = Small polyps in middle meatus not reaching below inferior border of the middle turbinate; 2 = Polyps reaching below lower border of the middle turbinate; 3 = Large polyps reaching lower border of the inferior turbinate or polyps medial to the middle turbinate; and 4 = Large polyps causing complete obstruction of the inferior nasal cavity. Baseline was the last assessment on or before the date of randomization. |       |       |     |
| Units: Score on a scale  |       |       |     |
| arithmetic mean  | 6.3   | 6.2   |     |
| standard deviation   | ± 0.9 | ± 1.0 | -   |
| Average Daily Nasal Congestion Score at<br>Baseline  |       |       |     |
| The Nasal Congestion Score (NCS) was assessed daily by the participant via an electronic diary as the response to the following question: Is your nose blocked? The four available response options were scored from 0 (no symptoms) to 3 (severe symptoms): 0 = Not at all; 1 = Mild; 2 = Moderate; and 3 = Severe. Baseline was defined as the average of the daily values recorded during the 7-day interval ending on the latest day prior to randomization such that the prior 7-day interval includes a recorded value on at least 4 of the 7 days of that interval.   |       |       |     |

| Average Daily Sense of Smell Score at<br>Baseline  |       |       |     |
| The Sense of Smell Score was assessed daily by the participant via an electronic diary as the response to the following question: Is your sense of smell reduced? The four available response options were scored from 0 (no symptoms) to 3 (severe symptoms): 0 = Not at all; 1 = Mild; 2 = Moderate; and 3 = Severe. Baseline was defined as the average of the daily values recorded during the 7-day interval ending on the latest day prior to randomization such that the prior 7-day interval includes a recorded value on at least 4 of the 7 days of that interval.   |       |       |     |
| Units: Score on a scale  |       |       |     |
| arithmetic mean  | 2.8   | 2.6   |     |
| standard deviation   | ± 0.4 | ± 0.8 | -   |
| Average Daily Posterior Rhinorrhea<br>Score at Baseline  |       |       |     |
| The Posterior Rhinorrhea Score was assessed daily by the participant via an electronic diary as the response to the following question: Do you feel dripping at the back of the nose? The four available response options were scored from 0 (no symptoms) to 3 (severe symptoms): 0=Not at all; 1=Mild; 2=Moderate; and 3=Severe. Baseline was defined as the average of the daily values recorded during the 7-day interval ending on the latest day prior to randomization such that the prior 7-day interval   |       |       |     |

|  |        |        |   |
|--|--------|--------|---|
| includes a recorded value on at least 4 of the 7 days of that interval.  |        |        |   |
| Units: Score on a scale  |        |        |   |
| arithmetic mean  | 2.0    | 1.7    |   |
| standard deviation   | ± 0.9  | ± 0.9  | - |
| Average Daily Anterior Rhinorrhea Score at Baseline  |        |        |   |
| The Anterior Rhinorrhea Score was assessed daily by the participant via an electronic diary as the response to the following question: Do you have a runny nose? The four available response options were scored from 0 (no symptoms) to 3 (severe symptoms): 0=Not at all; 1=Mild; 2=Moderate; and 3=Severe. Baseline was defined as the average of the daily values recorded during the 7-day interval ending on the latest day prior to randomization such that the prior 7-day interval includes a recorded value on at least 4 of the 7 days of that interval.                |        |        |   |
| Units: Score on a scale  |        |        |   |
| arithmetic mean  | 2.1    | 1.9    |   |
| standard deviation   | ± 0.8  | ± 0.8  | - |
| Daily Total Nasal Symptom Score (TNSS) at Baseline   |        |        |   |
| The Total Nasal Symptom Score (TNSS) was defined as the sum of the four individual scores for Nasal Congestion Score, Anterior Rhinorrhea Score, Posterior Rhinorrhea Score, and Sense of Smell Score, ranging from 0 (no symptoms) to 12 (most severe symptoms), assessed daily by the participant via an electronic diary. Baseline was defined as the average of the daily values recorded during the 7-day interval ending on the latest day prior to randomization such that the prior 7-day interval includes a recorded value on at least 4 of the 7 days of that interval. |        |        |   |
| Units: Score on a scale  |        |        |   |
| arithmetic mean  | 9.3    | 8.6    |   |
| standard deviation   | ± 1.9  | ± 2.5  | - |
| Total Sino-Nasal Outcome Test-22 (SNOT-22) Score at Baseline   |        |        |   |
| The SNOT-22 Questionnaire, a disease specific HRQoL measure, comprises a list of 22 symptoms and social or emotional consequences of the nasal disorder. Every participant was asked to rate how severe each problem had been for them over the past 2 weeks on a scale from 0 (no problem at all) to 5 (problem as bad as it can be). The total score is the sum of the scores for all 22 items, ranging from 0 to 110, with a lower score indicating less disease and better HRQoL. Baseline was defined as the last assessment on or before the date of randomization.          |        |        |   |
| Units: Score on a scale  |        |        |   |
| arithmetic mean  | 60.5   | 59.8   |   |
| standard deviation   | ± 15.3 | ± 19.7 | - |
| University of Pennsylvania Smell Identification Test (UPSIT) Score at Baseline   |        |        |   |
| The UPSIT is a 40-question instrument that measures an individual's ability to detect odors and ranges from 0 to 40, with a higher score indicating a better sense of smell. It is a self-administered "scratch-and-sniff" test provided in booklets that have 40 microencapsulated odorants, each with a multiple-choice option for the response. The number of correct responses is summed to provide a total score. Baseline was defined as the last assessment on or before the date of randomization.   |        |        |   |
| Units: Score on a scale  |        |        |   |
| arithmetic mean  | 13.9   | 12.8   |   |
| standard deviation   | ± 7.4  | ± 7.9  | - |

## End points

### End points reporting groups

|   |            |
|---|------------|
| Reporting group title   | Placebo    |
| Reporting group description:  |            |
| Participants received matching placebo as a subcutaneous injection once every 2 weeks or once every 4 weeks. The dose and dosing frequency was determined by serum total IgE level and body weight using the study-drug dosing table. All participants were also treated during the entire study with intranasal corticosteroids (mometasone nasal spray) as background therapy.  |            |
| Reporting group title   | Omalizumab |
| Reporting group description:  |            |
| Participants received omalizumab as a subcutaneous injection once every 2 weeks (q2w) or once every 4 weeks (q4w). The dose (from 75 mg up to 600 mg) and dosing frequency (q2w or q4w) was determined by serum total IgE level and body weight using the study-drug dosing table. All participants were also treated during the entire study with intranasal corticosteroids (mometasone nasal spray) as background therapy. |            |

### Primary: Change From Baseline in Nasal Polyp Score (NPS) at Week 24

|   |  |
|---|--|
| End point title   | Change From Baseline in Nasal Polyp Score (NPS) at Week 24 |
| End point description:  |  |
| Total NPS ranges from 0 to 8 (sum of 0-4 for left and right nasal passage scores per the following criteria), with a lower score indicating smaller-sized nasal polyps: 0 = No polyps; 1 = Small polyps in the middle meatus not reaching below the inferior border of the middle turbinate; 2 = Polyps reaching below the lower border of the middle turbinate (modified to accommodate those with a middle turbinectomy, such that polyp must have reached the top of the inferior turbinate.); 3 = Large polyps reaching the lower border of the inferior turbinate or polyps medial to the middle turbinate; and 4 = Large polyps causing complete obstruction of the inferior nasal cavity. Two blinded primary independent expert readers reviewed every post-screening recorded video endoscopy for a given participant to determine total NPS. A third reader chose one of the two scores to be used for analysis in cases where there was any discrepancy in total NPS assigned between the two primary readers. |  |

### **Primary: Change From Baseline in Average Daily Nasal Congestion Score (NCS) at Week 24**

|                 |   |
|-----------------|---|
| End point title | Change From Baseline in Average Daily Nasal Congestion Score (NCS) at Week 24 |
|-----------------|---|

End point description:

The Nasal Congestion Score (NCS) was assessed daily by the participant via an electronic diary as the response to the following question: Is your nose blocked? The four available response options were scored from 0 (no symptoms) to 3 (severe symptoms): 0 = Not at all; 1 = Mild; 2 = Moderate; and 3 = Severe. For each study day, a score was calculated using an average of the prior 7 days among the available days within the pre-specified window (For Week 24: Study Days 155 to 186), excluding the study day itself, if a value had been recorded by the participant on at least 4 of the prior 7 days; otherwise, the 7-day prior average for that study day was to be considered missing. One calculated (non-missing) 7-day prior average was selected for analysis according to the study day with nearest proximity to Week 24 (Study Day 168), with the earlier selected in the case of a tie. Baseline was defined as the (non-missing) 7-day interval ending on the latest day prior to randomization.

## Secondary: Change From Baseline in Average Daily Nasal Congestion Score (NCS) at Week 16

|                 |   |
|-----------------|---|
| End point title | Change From Baseline in Average Daily Nasal Congestion Score (NCS) at Week 16 |
|-----------------|---|

End point description:

The Nasal Congestion Score (NCS) was assessed daily by the participant via an electronic diary as the response to the following question: Is your nose blocked? The four available response options, scored from 0 (no symptoms) to 3 (severe symptoms) were: 0 = Not at all; 1 = Mild; 2 = Moderate; and 3 = Severe. For each study day, a score was calculated using an average of the prior 7 days among the available days within the pre-specified window (For Week 16: Study Days 99 to 126), excluding the study day itself, if a value had been recorded by the participant on at least 4 of the prior 7 days; otherwise, the 7-day prior average for that study day was to be considered missing. One calculated (non-missing) 7-day prior average was selected for analysis according to the study day with nearest proximity to Week 24 (Study Day 112), with the earlier selected in the case of a tie. Baseline was defined as the (non-missing) 7-day interval ending on the latest day prior to randomization.

## Secondary: Change From Baseline in Participant Reported Health-Related Quality of Life (HRQoL) as Assessed by the Total Sino-Nasal Outcome Test (SNOT)-22 Questionnaire at Week 24

|                 |   |
|-----------------|---|
| End point title | Change From Baseline in Participant Reported Health-Related Quality of Life (HRQoL) as Assessed by the Total Sino-Nasal Outcome Test (SNOT)-22 Questionnaire at Week 24 |
|-----------------|---|

End point description:

The SNOT-22 Questionnaire, a disease specific HRQoL measure, comprises a list of 22 symptoms and social or emotional consequences of the nasal disorder. Every participant was asked to rate how severe each problem had been for them over the past 2 weeks on a scale from 0 (no problem at all) to 5 (problem as bad as it can be). The total score is the sum of the scores for all 22 items, ranging from 0 to 110, with a lower score indicating less disease and better HRQoL. A negative score indicates a decrease (or improvement) from the baseline score.

A participant was considered to have had the event of requiring rescue treatment if they had taken systemic corticosteroids for 3 or more consecutive days or had nasal polypectomy at any point between randomization and Week 24; if the participant had greater than 155 days of follow-up on study and had not received rescue treatment, then they did not have the event. Participants with less than 155 days of follow-up on the study were classified as having had the event if they discontinued study drug due to adverse event, progressive disease, or lack of efficacy and remained missing; if the participant had less than 155 days of follow-up on study and had not already met these criteria, they were classified as having a missing outcome. The null hypothesis was to be assessed by the Wald Chi-square test of the treatment term in the logistic regression model. If model convergence was an issue, then Fisher's Exact test was to be used.

| End point title | Number of Participants With Reduction in the Need for Surgery for Nasal Polyps by Week 24, as Defined by an NPS of $\leq 4$ (Unilateral Score of $\leq 2$ on Each Side) and Improvement in SNOT-22 Score of $\geq 8.9$ |
|-----------------|--|

End point description:

A participant was considered to have had the event of reduction in the need for surgery for nasal polyps if they had a Nasal Polyp Score (NPS) of  $\leq 4$  and an improvement in the SNOT-22 score of  $\geq 8.9$  (minimal important difference) without rescue treatment at Week 24; if the participant had received rescue treatment or had discontinued study drug due to adverse event, progressive disease, or lack of efficacy and remained missing, then they did not have the event. Participants without an intercurrent event and without valid Week 24 assessments of both NPS and SNOT-22 were classified as having a missing outcome. The null hypothesis was to be assessed by the Wald Chi-square test of the treatment term in the logistic regression model. If model convergence was an issue, then Fisher's Exact test was to be used.

## Secondary: Change From Baseline in Average Daily Total Nasal Symptom Score (TNSS) at Week 24

| End point title   | Change From Baseline in Average Daily Total Nasal Symptom Score (TNSS) at Week 24 |
|---|---|
| End point description:  |   |
| The Total Nasal Symptom Score (TNSS) was defined as the sum of the four individual scores for Nasal Congestion Score, Anterior Rhinorrhea Score, Posterior Rhinorrhea Score, and Sense of Smell Score, ranging from 0 (no symptoms) to 12 (most severe symptoms), assessed daily by the participant via an electronic diary. For each study day, a score was calculated using an average of the prior 7 days among the available days within the pre-specified window (For Week 24: Study Days 155 to 186), excluding the study day itself, if a value had been recorded by the participant on at least 4 of the prior 7 days; otherwise, the 7-day prior average for that study day was to be considered missing. One calculated (non-missing) 7-day prior average was selected for analysis according to the study day with nearest proximity to Week 24 (Study Day 168), with the earlier selected in the case of a tie. Baseline was defined as the (non-missing) 7-day interval ending on the latest day prior to randomization. |   |

## Secondary: Number of Participants who Experienced at Least One Adverse Event by Greatest Severity

| End point title   | Number of Participants who Experienced at Least One Adverse Event by Greatest Severity |
|---|--|
| End point description:  |  |
| All adverse events (AE) were treatment emergent AEs, defined as any new AE or any worsening of an existing condition with an onset date on or after the first study drug administration date. AEs were assessed for severity according to the following grading scale: mild (discomfort noticed, but no disruption of normal daily activity), moderate (discomfort sufficient to reduce or affect normal daily activity), or severe (incapacitating with inability to work or to perform normal daily activity). The terms "severe" and "serious" are not synonymous; regardless of severity, some events may have also met seriousness criteria. Multiple occurrences of the same AE in one individual are counted once at the greatest intensity. |  |

## Secondary: Serum Concentration of Omalizumab at Specified Timepoints

|                 |   |
|-----------------|---|
| End point title | Serum Concentration of Omalizumab at Specified Timepoints |
|-----------------|---|

End point description:

Serum concentrations of omalizumab were quantified using an enzyme-linked immunoabsorbent assay (ELISA) with a lower limit of quantification of 28.0 nanograms per millilitre. The value '9999999' indicates that the mean and standard deviation at Day 1 (before dosing) were non-reportable because values for all participants (except for 3) were below the lower limit of quantification.

Notes:

[15] - Only omalizumab-treated participants at each timepoint were included in this analysis.

## Statistical analyses

No statistical analyses for this end point

## Secondary: Serum Concentration of Total and Free Immunoglobulin E (IgE) at Specified Timepoints

|                 |  |
|-----------------|--|
| End point title | Serum Concentration of Total and Free Immunoglobulin E (IgE) at Specified Timepoints |
|-----------------|--|

End point description:

Serum total immunoglobulin E (IgE) and free IgE were measured throughout the 24-week blinded treatment period as target engagement biomarkers of omalizumab. Free IgE was quantified using an enzyme-linked immunosorbent assay (ELISA) with a lower limit of quantification of 0.83 International Units per millilitre (IU/mL) to an upper limit of quantification of 62.5 IU/mL. The value '999999' indicates that the mean and standard deviation were non-reportable because values for half (or more) of the participants were greater than the upper limit of quantification.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

From Baseline until end of safety follow-up (up to 28 weeks)

Adverse event reporting additional description:

The safety analysis set consisted of all participants who received at least one dose of study drug, grouped according to treatment received during the treatment period.

### Reporting groups

|                       |            |
|-----------------------|------------|
| Reporting group title | Omalizumab |
|-----------------------|------------|

Reporting group description:

Participants received omalizumab as a subcutaneous injection once every 2 weeks (q2w) or once every 4 weeks (q4w). The dose (from 75 mg up to 600 mg) and dosing frequency (q2w or q4w) was determined by serum total IgE level and body weight using the study-drug dosing table. All participants were also treated during the entire study with intranasal corticosteroids (mometasone nasal spray) as background therapy.

|                       |         |
|-----------------------|---------|
| Reporting group title | Placebo |
|-----------------------|---------|

Reporting group description:

Participants received matching placebo as a subcutaneous injection once every 2 weeks or once every 4 weeks. The dose and dosing frequency was determined by serum total IgE level and body weight using the study-drug dosing table. All participants were also treated during the entire study with intranasal corticosteroids (mometasone nasal spray) as background therapy.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

| Date            | Amendment   |
|-----------------|---|
| 11 October 2017 | The key changes in Protocol version 2 are summarized: -An additional exclusion criterion was added to exclude subjects with a history of myocardial infarction, unstable angina, cerebrovascular accident, or transient ischemic attack or a known history of a hypercoagulable disorder.; -The inclusion criteria were updated to specify acceptable methods of contraception. Barrier methods with use of spermicides allowed under Protocol version 1 were not permitted and acceptable methods included surgical sterilization, hormonal contraception, and intrauterine device. Also, four additional urine pregnancy tests were added to the treatment period.; -Viral serologies for HIV, hepatitis B, and hepatitis C were added during screening at Day -35.; -Additional specifications were added to the section on the management of subjects who experienced specific AEs. While liver injury had not been described as a risk associated with omalizumab, this new section specified how study drug should be managed for subjects who experienced drug induced liver injury. |

Notes:
