Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	20 June 2022
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	09 July 2021
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To evaluate the pharmacokinetics (PK) of Obeticholic acid (OCA) and its conjugates, glycine 6 α -ethyl chenodeoxycholic acid (glyco-OCA) and taurine 6 α -ethyl chenodeoxycholic acid (tauro-OCA), and OCA metabolite glucuronide (OCA-glucuronide) compared with placebo. To evaluate the safety and tolerability of OCA treatment compared with placebo.

Protection of trial subjects:

The study was performed in accordance with ethical principles that have their origin in the Declaration of Helsinki and are consistent with International Council for Harmonisation (ICH)/Good Clinical Practice (GCP), applicable regulatory requirements and the Sponsor's policies.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	22 June 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 2
Country: Number of subjects enrolled	Belgium: 1
Country: Number of subjects enrolled	Estonia: 1
Country: Number of subjects enrolled	Germany: 1
Country: Number of subjects enrolled	Lithuania: 2
Country: Number of subjects enrolled	United States: 8
Country: Number of subjects enrolled	Australia: 1

Country: Number of subjects enrolled	Argentina: 4
Worldwide total number of subjects	22
EEA total number of subjects	7

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0

Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	12
From 65 to 84 years	10
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This study was conducted at study sites in the United States, Argentina, Belgium, Spain, Lithuania, Brazil, Australia, Germany, Estonia, Italy, Canada, and Hungary.

Pre-assignment

Screening details:

A total of 31 participants were screened and 22 participants were randomized.

Period 1

Period 1 title	Double Blind (DB), up to Week 48
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Participants received OCA matching placebo tablets orally once weekly or twice weekly for the duration of at least 48 Weeks.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

OCA matching placebo was administered per schedule specified in the arm description.

Arm title	Obeticholic Acid (OCA)
------------------	------------------------

Arm description:

Participants initiated treatment with OCA 5 milligrams (mg) tablets orally once weekly. At Week 12, if there were no safety concerns, the dose was up-titrated to OCA 5 mg twice weekly. Every 6 weeks thereafter, based on tolerability assessments, further up-titration of dose was considered. At each titration visit, the participants started the higher dose regimen no earlier than 2 days after the prior dose. The maximum dose titration was OCA 10 mg twice weekly at least 3 days apart. The minimum treatment duration was 48 Weeks.

Arm type	Experimental
Investigational medicinal product name	Obeticholic Acid
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

OCA was administered per dose and schedule specified in the arm description.

Number of subjects in period 1	Placebo	Obeticholic Acid (OCA)
Started	12	10

Period 2

Period 2 title	DB Extension, Week 48 up to 3 Years
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Participants, who had completed their 48-week treatment, could continue the treatment until all randomized participants had completed their 48-week treatment period and the database for that period was locked (total duration: approximately up to 3 years).

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

OCA matching placebo was administered per the schedule specified in the arm description.

Arm title	Obeticholic Acid (OCA)
------------------	------------------------

Baseline characteristics

Reporting groups

Reporting group title	Placebo
Reporting group description:	
Participants received OCA matching placebo tablets orally once weekly or twice weekly for the duration of at least 48 Weeks.	
Reporting group title	Obeticholic Acid (OCA)
Reporting group description:	
Participants initiated treatment with OCA 5 milligrams (mg) tablets orally once weekly. At Week 12, if there were no safety concerns, the dose was up-titrated to OCA 5 mg twice weekly. Every 6 weeks thereafter, based on tolerability assessments, further up-titration of dose was considered. At each titration visit, the participants started the higher dose regimen no earlier than 2 days after the prior dose. The maximum dose titration was OCA 10 mg twice weekly at least 3 days apart. The minimum treatment duration was 48 Weeks.	

Reporting group values	Placebo	Obeticholic Acid (OCA)	Total
Number of subjects	12	10	22
Age categorical Units: Subjects			
Age continuous Units: years			
arithmetic mean	62.5	60.5	
standard deviation	± 9.10	± 10.19	-
Gender categorical Units: Subjects			
Female	10	6	16
Male	2	4	6
Ethnicity Units: Subjects			
Hispanic or Latino	6	4	10
Not Hispanic or Latino	6	6	12
Unknown or Not Reported	0	0	0
Race Units: Subjects			
American Indian or Alaska Native	1	0	1
Asian	0	0	0
Native Hawaiian or Other Pacific Islander	0	0	0
Black or African American	0	0	0
White	11	10	21
Child-Pugh Score Component Category (Ascites Categories)			
Number of participants with Child-Pugh component - ascites categories of none, mild, and moderate-severe has been reported. The assessment of ascites was based on the investigator's discretion.			
Units: Subjects			
None	6	5	11
Mild	5	3	8
Moderate to Severe	1	2	3
Child-Pugh Score Component Category			

(Prothrombin Time Categories)			
Number of participants with Child-Pugh component - prothrombin time (measured as INR) in categories of <1.7, 1.7 - 2.3, and >2.3 has been reported.			
Units: Subjects			
<1.7	12	10	22
1.7-2.3	0	0	0
>2.3	0	0	0
Child-Pugh Score Component Category (Serum Albumin Categories)			
Number of participants with Child-Pugh component - serum albumin levels in categories of >35 gram per liter (g/L), 28-35 g/L, or <28 g/L has been reported.			
Units: Subjects			
>35 gram per liter (g/L)	3	4	7
28 - 35 g/L	8	5	13
<28 g/L	1	1	2
Child-Pugh Score Component Category (Total Bilirubin Categories)			
Number of participants with Child-Pugh component - total bilirubin levels in categories of <34 micromole per liter (μmol/L), 34-50 μmol/L, and >50 μmol/L has been reported.			
Units: Subjects			
<34 micromole per liter (μmol/L)	3	5	8
34-50 μmol/L	5	0	5
>50 μmol/L	4	5	9
Child-Pugh Score Component Category (Hepatic Encephalopathy Categories)			
Grade 0: normal consciousness, normal personality, normal neurological examination, normal electroencephalogram. Grade 1: restless, sleep disturbed, irritable/agitated, tremor, impaired handwriting, 5 cycles, per second (cps) waves. Grade 2: lethargic, time-disoriented, inappropriate, asterixis, ataxia, slow triphasic waves. Grade 3: somnolent, stuporous, place-disoriented, hyperactive reflexes, rigidity, slower waves. Grade 4: unrousable coma, no personality/behavior, decerebrate, slow 2-3 cps delta activity.			
Units: Subjects			
Grade 0	7	7	14
Grade 1 or 2	5	3	8
Grade 3 or 4	0	0	0
Model of End-stage Liver Disease (MELD) Score			
The MELD scoring system is used to assess the severity of chronic liver disease. The MELD score is derived from the participant's serum total bilirubin, serum creatinine, and prothrombin international normalized ratio (INR): $3.78 \times \log \text{normal (ln) [total bilirubin (mg/deciliter [dL])]} + 11.2 \times \ln[\text{INR}] + 9.57 \times \ln[\text{serum creatinine (mg/dL)}] + 6.43$. The MELD score ranges from 6 to 40 with higher scores indicating more severe liver disease and a worse outcome.			
Units: Score on a scale			
median	11.75	12.75	
inter-quartile range (Q1-Q3)	10.60 to 13.50	9.50 to 16.00	-
MELD-Sodium (Na) Score			
The MELD-Na scoring system is used to assess the severity of chronic liver disease in the participants with an initial MELD(i) score greater than 11. MELD-Na score is derived from the participant's serum total bilirubin, serum creatinine, INR, and sodium. The MELD-Na score is re-calculated as follows: $\text{MELD-Na} = \text{MELD(i)} + 1.32 \times (137 - \text{Na}) - [0.033 \times \text{MELD(i)} \times (137 - \text{Na})]$. MELD score ranges from 6-40 with higher scores indicating more severe liver disease and a worse outcome.			
Units: score on a scale			
median	11.75	13.25	
inter-quartile range (Q1-Q3)	10.60 to 14.25	9.50 to 16.00	-
Child-Pugh Score			
The Child-Pugh classification was a scoring system used for the classification of the severity of cirrhosis. It included three continuous variables (bilirubin, albumin, and INR) and two discrete variables (ascites			

and encephalopathy). Each variable was scored 1-3 with 3 indicating most severe derangement. The determination of Child-Pugh score ranged from 5 to 15. The higher the score, the sicker the participant.

Units: score on a scale median inter-quartile range (Q1-Q3)	8.0 7.0 to 8.0	8.0 7.0 to 8.0	-
Total Bilirubin Units: µmol/L median inter-quartile range (Q1-Q3)	45.38 34.57 to 55.79	41.50 19.00 to 106.88	-
Direct Bilirubin Units: µmol/L median inter-quartile range (Q1-Q3)	21.58 15.37 to 37.18	25.50 8.00 to 76.00	-
Alkaline Phosphatase Units: unit per liter (U/L) median inter-quartile range (Q1-Q3)	216.0 144.5 to 290.0	267.5 151.0 to 381.0	-
Alanine Aminotransferase Units: U/L median inter-quartile range (Q1-Q3)	47.5 31.0 to 60.5	38.0 27.0 to 56.0	-
Aspartate Aminotransferase Units: U/L median inter-quartile range (Q1-Q3)	60.0 45.5 to 95.5	65.5 46.0 to 104.0	-
Gamma Glutamyl Transferase Units: U/L median inter-quartile range (Q1-Q3)	98.0 36.0 to 152.0	103.0 53.0 to 191.0	-
Prothrombin INR Units: INR median inter-quartile range (Q1-Q3)	1.15 1.10 to 1.20	1.23 1.10 to 1.30	-
Creatinine Units: µmol/L median inter-quartile range (Q1-Q3)	60.000 51.000 to 96.732	60.172 55.000 to 95.472	-
Albumin Units: gram per liter (g/L) median inter-quartile range (Q1-Q3)	34.50 33.00 to 36.75	33.00 30.00 to 36.50	-
Platelets			
Number analyzed (n) for Placebo arm = 11 Number analyzed (n) for OCA arm = 9			
Units: 10 ⁹ /L median inter-quartile range (Q1-Q3)	141.5 80.0 to 160.5	132.5 84.5 to 158.5	-
Total Bile Acids Concentration			
Total bile acids (micromole [µM]) = total ursodeoxycholic acid (unconjugated, glyco-conjugate, tauro-conjugate) in µM + total chenodeoxycholic acid (unconjugated, glyco-conjugate, tauro-conjugate) in µM + total deoxycholic acid (unconjugated, glyco-conjugate, tauro-conjugate) in µM + total cholic acid (unconjugated, glyco-conjugate, tauro-conjugate) in µM + total lithocholic acid (unconjugated, glyco-conjugate, tauro-conjugate) in µM.			

Number analyzed (n) for Placebo arm = 11			
Units: μM			
median	149	127	
inter-quartile range (Q1-Q3)	90.3 to 307	65.3 to 176	-
Total Endogenous Bile Acids Concentration			
Number analyzed (n) for Placebo arm = 11			
Units: μM			
median	64.7	42.1	
inter-quartile range (Q1-Q3)	29.4 to 75.2	18.6 to 69.6	-
7 α -hydroxy-4-cholesten-3-one (C4)			
Number analyzed (n) for Placebo arm = 11			
Units: ng/mL			
median	0.708	0.814	
inter-quartile range (Q1-Q3)	0.372 to 5.16	0.472 to 2.09	-
Fibroblast Growth Factor-19 (FGF-19)			
Number analyzed (n) for Placebo arm = 11			
Units: picograms per milliliter (pg/mL)			
median	278	163	
inter-quartile range (Q1-Q3)	105 to 618	139 to 359	-

End points

End points reporting groups

Reporting group title	Placebo
Reporting group description: Participants received OCA matching placebo tablets orally once weekly or twice weekly for the duration of at least 48 Weeks.	
Reporting group title	Obeticholic Acid (OCA)
Reporting group description: Participants initiated treatment with OCA 5 milligrams (mg) tablets orally once weekly. At Week 12, if there were no safety concerns, the dose was up-titrated to OCA 5 mg twice weekly. Every 6 weeks thereafter, based on tolerability assessments, further up-titration of dose was considered. At each titration visit, the participants started the higher dose regimen no earlier than 2 days after the prior dose. The maximum dose titration was OCA 10 mg twice weekly at least 3 days apart. The minimum treatment duration was 48 Weeks.	
Reporting group title	Placebo
Reporting group description: Participants, who had completed their 48-week treatment, could continue the treatment until all randomized participants had completed their 48-week treatment period and the database for that period was locked (total duration: approximately up to 3 years).

Primary: Maximum Observed Concentration (Cmax) of Total OCA at Week 12

End point title	Maximum Observed Concentration (Cmax) of Total OCA at Week 12 ^[1]
-----------------	--

End point description:

Total OCA is molar sum of unconjugated OCA, glyco-OCA, and tauro-OCA.

Analysis population description (APD): PK Population: participants who received OCA and had adequate concentration-time profile to characterize OCA and its conjugates and must not have had any major protocol deviations that potentially affect exposure level. Results of PK were planned to be listed by dose regimen. Participants who received planned dose regimen and had available data were included. PK of OCA 5 mg twice weekly or 10 mg twice weekly at Week 12 are not applicable as no participant started 5 mg twice weekly or 10 mg twice weekly at Week 12.

End point type	Primary
----------------	---------

End point timeframe:

Pre-dose (30 minutes before administration) and 0.5, 0.75, 1, 1.5, 2, 2.5, 3, 4, 5, 6, 7, 8, 9, and 24 hours post-dose at Week 12

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Per protocol, statistical analysis was not planned for this endpoint.

Number of subjects analysed	0 ^[212]	2	1 ^[213]	
Units: ratio				
arithmetic mean (standard deviation)	()	2.59 (± 0.00903)	5.60 (± 99999)	

Notes:

[212] - No participant received OCA 5 mg once weekly at Week 48.

[213] - 99999: Standard deviation is not estimable as there is only one participant.

Statistical analyses

No statistical analyses for this end point

Primary: MRCmax of Tauro-OCA at Week 48

End point title	MRCmax of Tauro-OCA at Week 48 ^[214]
-----------------	---

End point description:

MRCmax was the ratio of Cmax of Tauro-OCA (metabolite) to Cmax of OCA (parent drug) * ratio of molecular weight of OCA to molecular weight of Tauro-OCA, where Cmax is the maximum observed concentration.

APD: Results of PK were planned to be listed by the dose regimen. Participants in the PK population who received the planned dose regimen and had available data were included in the analysis. PK of OCA 5 mg once weekly at Week 48 is not applicable as participants received either OCA 5 mg twice daily or 10 mg twice daily and no participant received OCA 5 mg once weekly at Week 48.

End point type	Primary
----------------	---------

End point timeframe:

Pre-dose (30 minutes before administration) and 0.5, 0.75, 1, 1.5, 2, 2.5, 3, 4, 5, 6, 7, 8, 9, and 24 hours post-dose at Week 48

Primary: Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Serious Adverse Events (SAEs)

End point title	Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Serious Adverse Events (SAEs) ^[281]
-----------------	--

End point description:

An adverse event (AE) was any unfavorable & unintended sign (including abnormal laboratory finding), symptom, or disease temporally associated with use of study drug, whether or not related to study drug. An SAE was any AE that resulted in death, was life-threatening, resulted in a persistent or significant disability/incapacity, resulted in in-patient hospitalization or prolonged an existing hospitalization, was a congenital anomaly/birth defect, or was an important medical event that could jeopardize participant or could have required medical intervention to prevent one of the outcomes listed above. TEAE was defined as any AE if it met one or more of the following criteria: 1)An AE started on or after first study drug dose & within 30 days after last dose of study drug, 2)An AE occurred prior to first study drug dose that worsens after the first study drug dose.

APD: Safety Population included all participants who received at least 1 dose of investigational product (OCA or placebo)

Secondary: Change From Baseline in the Model of End-stage Liver Disease (MELD) Score at Weeks 3, 6, 12, 18, 24, 30, 36, 42, and 48; and Extension Months 3, 6, 9, 12, and 15

End point title	Change From Baseline in the Model of End-stage Liver Disease
-----------------	--

End point description:

The MELD scoring system is used to assess the severity of chronic liver disease. The MELD score is derived from the participant's serum total bilirubin, serum creatinine, and prothrombin international normalized ratio (INR): $3.78 \times \log \text{normal (ln)} [\text{total bilirubin (mg/deciliter [dL])}] + 11.2 \times \ln[\text{INR}] + 9.57 \times \ln[\text{serum creatinine (mg/dL)}] + 6.43$. The MELD score ranges from 6 to 40 with higher scores indicating more severe liver disease and a worse outcome.

Secondary: Change From Baseline in MELD-Sodium (Na) Score at Weeks 3, 6, 12, 18, 24, 30, 36, 42, and 48; and Extension Months 3, 6, 9, 12, and 15

End point title	Change From Baseline in MELD-Sodium (Na) Score at Weeks 3, 6, 12, 18, 24, 30, 36, 42, and 48; and Extension Months 3, 6, 9, 12, and 15
-----------------	--

End point description:

The MELD-Na scoring system is used to assess the severity of chronic liver disease in the participants with an initial MELD(i) score greater than 11. MELD-Na score is derived from the participant's serum total bilirubin, serum creatinine, INR, and sodium. The MELD-Na score is re-calculated as follows: MELD-Na = MELD(i) + 1.32*(137-Na) - [0.033*MELD(i)*(137-Na)]. MELD score ranges from 6-40 with higher scores indicating more severe liver disease and a worse outcome.

APD: Participants in the ITT population with available data were analyzed.

Statistical analyses

Secondary: Change From Baseline in Child-Pugh Score at Day 1, Weeks 6, 12, 18, 24, 30, 36, and 48; and Extension Months 3, 6, 9, 12, and 15

End point title	Change From Baseline in Child-Pugh Score at Day 1, Weeks 6, 12, 18, 24, 30, 36, and 48; and Extension Months 3, 6, 9, 12, and 15
-----------------	--

End point description:

The Child-Pugh classification was a scoring system used for the classification of the severity of cirrhosis. It included three continuous variables (bilirubin, albumin, and INR) and two discrete variables (ascites and encephalopathy). Each variable was scored 1-3 with 3 indicating most severe derangement. The determination of child-pugh score ranged from 5 to 15. The higher the score, the sicker the participant.

APD: Participants in the ITT population with available data were analyzed.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Baseline up to approximately 3 years

Adverse event reporting additional description:

The Safety Population included all participants who received at least 1 dose of investigational product (OCA or placebo).

Assessment type	Systematic
-----------------	------------

Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	24.0
--------------------	------

Reporting groups

Reporting group title	Obeticholic Acid (OCA)
-----------------------	------------------------

Reporting group description:

Participants initiated treatment with OCA 5 mg tablets orally once weekly. At Week 12, if there were no safety concerns, the dose was up-titrated to OCA 5 mg twice weekly. Every 6 weeks thereafter, based on tolerability assessments, further up-titration of dose was considered. At each titration visit, the participants started the higher dose regimen no earlier than 2 days after the prior dose. The maximum dose titration was OCA 10 mg twice weekly at least 3 days apart. The minimum treatment duration was 48 Weeks. Participants, who had completed their 48 Week treatment, could continue the treatment until all randomized participants had completed their 48 Week treatment period and the database for that period was locked (total duration: approximately up to 3 years).

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Participants received OCA matching placebo tablets orally once weekly or twice weekly for the duration of at least 48 Weeks. Participants, who had completed their 48 Week treatment, could continue the treatment until all randomized participants had completed their 48 Week treatment period and the database for that period was locked (total duration: approximately up to 3 years).

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 May 2017	<p>The changes in Version 2 were incorporated based on Food and Drug Administration (FDA) review of Version 1 of the protocol:</p> <ul style="list-style-type: none">• Background information was included to estimate the exposure difference between healthy subjects and subjects with moderate hepatic impairment to support the rationale for dose selection• Additional PK sampling times were added to adequately characterize the PK of OCA and its active metabolites at steady state in subjects with moderate and severe impairment when dosing weekly to biweekly• The period between screening and Day 1 was extended to at least 14 days to establish a baseline for serum biomarkers with at least two samples two weeks apart• The Week 3 contact Visit by email/telephone was changed to a Safety Visit to assess evidence of early hepatotoxicity• Guidelines were added to assess subjects for evidence of hepatotoxicity at each visit
04 January 2018	<ul style="list-style-type: none">• The Introduction was revised to highlight the need for close monitoring specifically in subjects with clinical evidence of hepatic decompensation and other complications due to advanced cirrhosis.• Dosing regimens were updated to modify dosing to one regimen for subjects with moderate and severe hepatic impairment [e.g., same for child-pugh B and child-pugh C], not to exceed 10 mg twice weekly, to align with label dosing guidelines. Titration was then only based on tolerability and not CP score.• Reference to an option for open-label treatment was removed. An open-label extension was to be considered only after review of blinded safety and PK data from the double-blind treatment period.• Protocol was updated with discontinuation criteria for decompensation events and biochemical thresholds. A plan for monitoring and drug-induced liver injury algorithm was included to ensure careful monitoring and drug interruption/discontinuation. Analysis of decompensation events as adverse events of interest was added. Additionally, "Close Observation" per FDA Guidance for Industry on Drug Induced Liver Injury (DILI) was clearly defined in the protocol to ensure that subjects who experienced a potential DILI underwent a full evaluation.• Guidance was added that subjects should have been instructed to contact the site promptly upon awareness if they developed signs and symptoms of potential hepatic decompensation.• Guidance was added that the Investigator should have contacted the study Medical Monitor upon awareness when any signs and symptoms of hepatic decompensation were observed in any subject.• Guidance was added for monitoring amylase and lipase levels in subjects with suspected acute pancreatitis.• Gallbladder assessments were added at Screening or Day 1.
15 February 2019	<ul style="list-style-type: none">• Updated clinical development data based on IB Version 18 (31 Jan 2019).• Exclusion criteria were updated to mitigate the inclusion of subjects who may have been pregnant or breastfeeding as an additional safety precaution or who had a known history of human immunodeficiency syndrome infection.• Exclusion criteria and prohibited medications sections were updated to prevent the concomitant use of fibrates and OCA. The primary objective of this study was to characterize the PK of OCA in subjects with PBC and mild to severe hepatic impairment. The drug-drug interactions of OCA with fibrates were not yet fully characterized in any population and were being restricted in this study as an additional safety precaution until data were available in a less advanced population.

19 May 2020	<ul style="list-style-type: none"> Addendum was issued to multiple countries to describe the requirements and processes under which subjects who were unable to return to study sites during the COVID-19 pandemic may have completed protocol specified assessments and continued to receive investigational product until in-person site visits could resume.
