

Clinical trial results:

METIMMOX: COLORECTAL CANCER METASTASIS – SHAPING ANTI-TUMOR IMMUNITY BY OXALIPLATIN

Summary

EudraCT number	2017-001845-29
Trial protocol	NO
Global end of trial date	15 March 2024

Results information

Result version number	v1 (current)
This version publication date	09 February 2025
First version publication date	09 February 2025
Summary attachment (see zip file)	First-line oxaliplatin-based chemotherapy and nivolumab for metastatic microsatellite-stable colorectal cancer-the randomised METIMMOX trial (Ree-2024-First-line oxaliplatin-based chemothe.pdf)

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	15 March 2024
Is this the analysis of the primary completion data?	Yes
Primary completion date	15 March 2024
Global end of trial reached?	Yes
Global end of trial date	15 March 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Primary objective: To determine progression-free survival, in terms of failure of treatment strategy, of sequential treatment with the Nordic FLOX regimen and nivolumab compared with the standard-of-care Nordic FLOX regimen in previously untreated microsatellite-stable metastatic colorectal cancer.

Protection of trial subjects:

Subjects will be evaluated for safety and tolerability if they have received any study drug. Toxicity assessments will be continuous during the treatment phase and formally recorded at each new therapy cycle, and every 8 weeks during planned breaks from active study therapy, and should be done in person. Once subjects reach the survival follow-up phase, either in-person or documented telephone calls to assess the subject's status are acceptable.

AE and laboratory values will be graded according to CTCAE v4.0. The start and stop time of the study therapy infusions will be documented. Additional measures, including non-study required laboratory tests, will be performed as clinically indicated or to comply with local regulations. Laboratory toxicities (e.g., suspected drug-induced liver enzyme evaluations) will be monitored during the follow-up phase via local laboratories until all study drug-related toxicities resolve, return to baseline, or are deemed irreversible. Some of the assessments referred to in this section may not be captured as data in the CRF. They are intended to be used as safety monitoring by the treating physician. Additional testing or assessments may be performed as clinically necessary or where required by institutional or local regulations.

Background therapy:

Administration of the FLOX regimen will be according to the schedule that was used in the NORDIC-VII Study [Tveit et al., 2012], which in recent years has also been implemented in clinical practice.

Evidence for comparator:

The concept referred to as immunogenic cell death (ICD) essentially implies cytotoxic damage of tumor cells by either radiation or systemic therapies and the resulting priming of tumor-targeting T lymphocytes via capture and presentation of shed tumor antigens by dendritic cells [Galluzzi et al., 2015]. Preclinical studies have highlighted oxaliplatin as an ICD-inducing agent [Tesniere et al., 2010; Zitvogel et al., 2010]. In mouse models, oxaliplatin has been shown to sensitize CRC and other adenocarcinomas to ICB therapy via enhanced tumor infiltration of cytotoxic T lymphocytes [Gou et al., 2014; Pfirschke et al., 2016]. Increasing clinical evidence also supports the notion that oxaliplatin is able to induce ICD [Pol et al., 2015] and thereby invoke efficacious anti-tumor immunity.

Actual start date of recruitment	01 March 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Norway: 76
Worldwide total number of subjects	76
EEA total number of subjects	76

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	38
From 65 to 84 years	38
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The 80 patients were enrolled between 29 May 2018 and 22 October 2021 from Akershus University Hospital, Oslo University Hospital and Sørlandet Hospital in the South-Eastern Region of Norway, as well as Haukeland University Hospital in the Western Region of Norway and St. Olavs Hospital in the Central Region of Norway.

Pre-assignment

Screening details:

Essential study inclusion criteria were age ≥ 18 years, measurable infradiaphragmatic (liver, peritoneal and/or nodal) metastatic manifestation(s) according to RECIST 1.1, and ECOG performance status 0-1. In addition, CRP < 60 mg/L was required at study entry.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

Tumour assessments were based on blinded independent central review according to RECIST 1.1 as the primary method and the consensus guidelines for assessment of response to immune-modulating therapies (iRECIST) as the subsidiary method, by means of CT scans repeated every 8 weeks throughout the study participation.

Arms

Are arms mutually exclusive?	Yes
Arm title	Control arm

Arm description:

The control arm patients were assigned to eight cycles of the FLOX regimen Q2W (oxaliplatin 85 mg/m² day 1 and bolus 5-fluorouracil 500 mg/m² and folinic acid 100 mg days 1–2)

Arm type	Active comparator
Investigational medicinal product name	Oxaliplatin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection/infusion
Routes of administration	Infusion

Dosage and administration details:

85 mg/m² (over 30–60 minutes) on day 1; bolus (over < 5 minutes)

Investigational medicinal product name	5-Fluorouracil
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection/infusion
Routes of administration	Infusion

Dosage and administration details:

500 mg/m² and 30 minutes later bolus (over < 10 minutes)

Arm title	Experimental arm
------------------	------------------

Arm description:

Experimental arm patients were scheduled for two cycles of FLOX Q2W before two cycles of nivolumab (240 mg flat dose) Q2W in an alternating schedule to a total of eight cycles.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Oxaliplatin

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse events were recorded for the time of study participation, and up to one year after treatment termination.

Adverse event reporting additional description:

2 patients died of adverse events before receiving nivolumab.

Assessment type	Systematic
