Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-002054-PIP01-16
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 August 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	27 July 2020
Global end of trial reached?	Yes
Global end of trial date	28 July 2020
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To demonstrate the efficacy of repeated daily doses of 40 microgram per kilogram (mcg/kg) per day and 120 mcg/kg/day odevixibat in children with progressive familial intrahepatic cholestasis Types 1 and 2 (PFIC1 and PFIC2), as determined by the following:

- Proportion of participants experiencing at least a 70% reduction in serum bile acid (s-BA) concentration from baseline to end of treatment or reaching a level ≤ 70 micromoles per liter (mcmol/L).
- Proportion of positive pruritus assessments at the participant level over the 24-week treatment period.

Protection of trial subjects:

Safety was evaluated throughout the study, including monitoring for adverse events (AEs) and concomitant medications, physical examinations, vital signs, laboratory tests (including chemistry, hematology, urinalysis, vitamins A and E, 25-hydroxy vitamin D, and international normalized ratio), and abdominal ultrasound at regularly scheduled and ad-hoc meetings. Hepatic events underwent review and adjudication of etiology by an independent Data Safety Monitoring Board.

Background therapy:

Eligible participants were randomized on Day 0 (Visit 3) in a 1:1:1 fashion to receive 40 mcg/kg/day or 120 mcg/kg/day of odevixibat, or matching placebo. Odevixibat was administered orally, once daily at doses of 40 mcg/kg/day or 120 mcg/kg/day based on randomized treatment. Odevixibat was supplied in 2 capsule sizes and 4 strengths: capsule size 0 (200 or 600 mcg strength) that could be opened and sprinkled on food and capsule size 3 (400 or 1200 mcg strength) to be swallowed intact but could be opened for participants unable to swallow the capsules whole. Treatment duration was 24 weeks with the possibility to continue treatment with odevixibat 120 mcg/kg/day in the open label extension study.

Evidence for comparator:

Placebo controlled

Actual start date of recruitment	16 May 2018
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	19 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	23
Children (2-11 years)	34
Adolescents (12-17 years)	5
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This Phase 3, double-blind, placebo-controlled study was conducted in children with PFIC at 33 study centers in 12 countries between 16 May 2018 and 28 July 2020.

Pre-assignment

Screening details:

The study included up to an 8-week screening period, a 24-week treatment period, and a 4-week follow-up period. A total of 62 participants were enrolled in the study.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Capsules for oral administration (to match active) once daily for 24 weeks.

Placebo: Placebo identical in appearance to active drug (A4250).

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	Placebo
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

Placebo was orally administered once daily in the morning for 24 weeks. For young children or in case of difficulties swallowing the capsules, capsules could be opened and the content sprinkled on soft foods.

Arm title	A4250 Low Dose
------------------	----------------

Arm description:

Capsules for oral administration (40 mcg/kg) once daily for 24 weeks.

A4250 (odevixibat): A4250 is a small molecule and selective inhibitor of ileal bile acid transporter (IBAT).

Arm type	Experimental
Investigational medicinal product name	Odevixibat
Investigational medicinal product code	A4250
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

40 mcg/kg/day was orally administered once daily in the morning for 24 weeks. For young children or in case of difficulties swallowing the capsules, capsules could be opened and the content sprinkled on soft foods.

Arm title	A4250 High Dose
------------------	-----------------

Arm description:

Capsules for oral administration (120 mcg/kg) once daily for 24 weeks.

A4250 (odevixibat): A4250 is a small molecule and selective inhibitor of IBAT.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Odevixibat
Investigational medicinal product code	A4250
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

120 mcg/kg/day was orally administered once daily in the morning for 24 weeks. For young children or in case of difficulties swallowing the capsules, capsules could be opened and the content sprinkled on soft foods.

Secondary: Change From Baseline in Sleep Parameters Based on the Albireo Observer-reported Outcome Instrument Over the 24- Week Treatment Period

End point title	Change From Baseline in Sleep Parameters Based on the Albireo Observer-reported Outcome Instrument Over the 24- Week Treatment Period
-----------------	---

End point description:

The sleep disturbance were recorded twice daily via electronic diary (eDiary). Participants and/or caregivers completed eDiary every day in the morning and evening. Morning diary was completed shortly after participant woke up and was used to record nighttime itching and scratching severity, aspects of sleep disturbance, and tiredness upon waking (AM scores). Evening/bedtime diary was completed just before participant went to bed and recorded participant's itching and scratching severity, and tiredness during the day (PM scores). Both morning and bedtime diaries included Albireo ObsRO and PRO items. Baseline was the average of 14-day scores before the first dose of study treatment. The FAS included all randomized participants who received at least 1 dose of study treatment. Here, n=number of participants with data collected at specific timepoints. SBS=Seeing blood due to scratching; HFA=Help falling asleep; SwC=Sleeping with the caregiver; TMIS=Taking medications to induce sleep.

Secondary: Proportion of Individual Assessments Meeting the Definition of a Positive Pruritus Assessment at the Participant Level Using the Albireo ObsRO Instrument Over the 24-Week Treatment Period

End point title	Proportion of Individual Assessments Meeting the Definition of a Positive Pruritus Assessment at the Participant Level Using the Albireo ObsRO Instrument Over the 24-Week Treatment Period
-----------------	---

End point description:

A positive pruritus assessment was defined as a scratching score of ≤ 1 or at least 1 point drop from baseline based on the Albireo ObsRO instrument. The proportion of positive pruritus assessment was calculated as the number of positive pruritus assessments divided by the total number of reported assessments only when more than 50% of planned assessment recorded by each participant. At each assessment, the AM or PM score was compared to the baseline AM or PM average, respectively. The FAS included all randomized participants who received at least 1 dose of study treatment.

Secondary: Number of Participants Underwent Biliary Diversion Surgery and Liver Transplantation

End point title	Number of Participants Underwent Biliary Diversion Surgery and Liver Transplantation
-----------------	--

End point description:

The number of participants underwent biliary diversion surgery and liver transplantation was determined. The FAS included all randomized participants who received at least 1 dose of study treatment.

End point type	Secondary
----------------	-----------

End point timeframe:

From Baseline (Day 1) up to Week 24

Secondary: Number of Participants Achieved Positive Pruritus Assessment for >50% of the Time Based on the Albireo ObsRO and PRO Instruments Over the 24-Week Treatment Period

End point title	Number of Participants Achieved Positive Pruritus Assessment for >50% of the Time Based on the Albireo ObsRO and PRO Instruments Over the 24-Week Treatment Period
-----------------	--

End point description:

A positive pruritus assessment was defined as a scratching score of ≤ 1 or at least 1 point drop from baseline based on the Albireo ObsRO and PRO instruments. The proportion of positive pruritus assessment was calculated as the number of positive pruritus assessments divided by the total number of reported assessments only when more than 50% of planned assessment recorded by each participant. The FAS included all randomized participants who received at least 1 dose of study treatment. Here, n= number of participants with data collected for each specific instrument.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All serious and non-serious AEs were collected once the caregiver/participant had signed the informed consent form (ICF) and until the post-treatment follow-up (Visit 10) or 28 days after the last dose of study treatment, approximately 28 weeks

Adverse event reporting additional description:

Treatment emergent adverse events (TEAEs) were defined as any AE that occurred after first dose or AE occurred before first dose but worsened in severity on or after first dose. Treatment emergent serious adverse events and treatment emergent non-serious AEs are reported here.

Assessment type	Non-systematic

Reporting groups

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Capsules for oral administration (to match active) once daily for 24 weeks.

Placebo: Placebo identical in appearance to active drug (A4250).

Reporting group title	A4250 Low Dose
-----------------------	----------------

Reporting group description:

Capsules for oral administration (40 mcg/kg) once daily for 24 weeks.

A4250 (odevixibat): A4250 is a small molecule and selective inhibitor of IBAT.

Reporting group title	A4250 High Dose
-----------------------	-----------------

Reporting group description:

Capsules for oral administration (120 mcg/kg) once daily for 24 weeks.

A4250 (odevixibat): A4250 is a small molecule and selective inhibitor of IBAT.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 December 2017	Number of participants: 15. <ul style="list-style-type: none">• Original protocol under which participants were first enrolled.
10 May 2018	Number of participants: 16. <ul style="list-style-type: none">• Clarified that enrolment of participants with PFIC1 was targeted to 15%.• Exclusion criterion 9 was revised to clarify that participants listed for liver transplant was not excluded if primary reason for listing was symptomatic pruritus and not disease progression.• Guidelines for contraceptive requirements were updated that required participants to use reliable contraceptive methods throughout duration of study and 90 days thereafter.• Additional examples of prohibited medications, including erythromycin and 4-phenylbutyrate were added.• Requirement for genetic testing at screening was removed for participants with prior genotyping results confirming PFIC1 or 2.• Procedure for breaking randomization code was clarified.• Calculation to determine participant eligibility relating to ObsRO data collection was revised.• Primary efficacy endpoint for US (and secondary endpoint for EU and RoW) was revised to include more data collected in analysis. Statistical analyses were modified to align with that change.• All secondary and exploratory endpoints referring to patient-related outcome/ObsRO instrument using a reference time point of Week 24 were revised to include a specified duration over treatment period, for example over first of last 3 or 5 months of treatment period.• Assessment of change in gamma-glutamyl transferase was added to exploratory endpoint.• Clarification was made to include all laboratory tests related to safety including vitamins, and alpha-fetoprotein.• Additional assessments for physical examination, vitamins, urine pregnancy test and blood sampling for Pharmacokinetic analysis were added.• Approach to calculate baseline weekly itching and scratching scores was revised.• Requirement of cholestatic marker elevations without alternative explanation was removed; alkaline phosphatase was removed from list of repeat liver profile assessments; The criterion of international normalized ratio increase was revised.

22 November 2018	<p>Number of participants: 6.</p> <ul style="list-style-type: none"> • Exclusion criterion 17 was revised to remove barrier protection as an acceptable contraceptive method. • Exclusion criterion 9 was revised to specify that participants will be excluded if their liver transplant is planned within 6 months of randomization. • Statistical methodology to analyze the primary efficacy endpoint for United States (and secondary endpoint of EU and ROW) of change in pruritus between active and placebo arms was revised. • Secondary endpoints of change from baseline to Week 24 in s-BA, alanine transaminase (ALT), and growth were updated to include additional assessments at Week 12. As a result, change from baseline in ALT and s-BA at Week 12 were removed from the list of exploratory endpoints. • The secondary endpoint of percentage of participants achieving meaningful reduction in caregiver-reported observed scratching was revised to include assessment of patient-reported outcomes and to indicate how “meaningful reduction” was defined. An additional assessment timepoint of Week 12 was also added. • The secondary endpoint of change from baseline in sleep parameters was updated so multiple timepoints were evaluated in the study period rather than a single timepoint at end of therapy. • The following additional secondary endpoints were added for all regions: <ul style="list-style-type: none"> - Proportion of individual assessments and of individual AM and PM assessments meeting the definition of a positive pruritus assessment at the participant level from Weeks 0-4, Weeks 0-8, Weeks 0-12, Weeks 0-18, Weeks 0-24, respectively, or the proportion of positive pruritus assessments at each 4-week interval. • The exploratory efficacy endpoint of change in patient-reported and observer-reported night-time itching and scratching severity scores was revised so both morning and evening scores were analyzed rather than a single daily score.
01 March 2019	<p>Number of participants: 8.</p> <ul style="list-style-type: none"> • Exclusion criterion 8 was updated so participants post biliary diversion surgery were eligible for the study. • Clarification was made to the secondary endpoint to assess liver transplantation events. • Revised baseline covariate in the ANCOVA model of US primary efficacy analysis to include both AM baseline and PM baseline pruritus scores, instead of the averaged value.
29 April 2019	<p>Number of participants: 9.</p> <ul style="list-style-type: none"> • The timing for rescreening was removed; participants could be rescreened at any time after failing eligibility criteria after consultation with the Medical Monitor. • Exclusion criterion 14 was revised to exclude participants with total bilirubin >10×upper limit of normal.
24 June 2019	<p>Number of participants: 8.</p> <ul style="list-style-type: none"> • The provision to allow participants experiencing intolerable symptoms of underlying disease to roll over to active treatment after completion of 12 weeks of the treatment period was removed.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
