

Clinical trial results:

A once weekly, repeated dose, placebo controlled, double blind, randomised cross-over trial investigating safety, efficacy and pharmacodynamics of FE 203799 in patients with short bowel syndrome with intestinal failure requiring parenteral support followed by an additional treatment period in an open label regimen.

Summary

EudraCT number	2017-002486-21

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	07 April 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	21 November 2019
Global end of trial reached?	Yes
Global end of trial date	21 November 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess the safety and tolerability of FE 203799 in patients with short bowel syndrome (SBS) with intestinal failure.

Protection of trial subjects:

This trial was conducted in accordance with the ICH GCP guidelines, including the archiving of essential documents, and with the ethical principles that have their origin in the Declaration of Helsinki. Personal data included in the clinical trial report were collected and processed in accordance with the EU General Data Protection Regulation.

Background therapy:

Parenteral support ≥ 3 times/week for ≥ 12 months according to the patient's medical record.

Evidence for comparator:

FE 203799 was compared to placebo.

Actual start date of recruitment	08 May 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Denmark: 8
Worldwide total number of subjects	8
EEA total number of subjects	8

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	5
From 65 to 84 years	3
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The subjects were recruited at a single trial centre in Denmark.

Pre-assignment

Screening details:

A total of 12 subjects were screened and 8 were randomised in the trial. The reasons for the screen failures were inadequate hepatic or renal function for 3 subjects, while the fourth screen failure subject was not considered eligible due to catheter sepsis, which occurred after the screening visit.

Period 1

Period 1 title	Placebo controlled, double-blind
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Blinding implementation details:

To minimise bias, part A of this trial was designed as a placebo controlled, double blind, randomised trial. Furthermore, since SBS is characterised by large heterogeneity, a cross-over design, where each patient acted as his/her own control in the analysis of the trial results, was chosen to minimise variation.

Arms

Are arms mutually exclusive?	Yes
Arm title	FE 203799 crossover to placebo

Arm description:

Repeated dose treatment with FE 203799 followed by cross-over to repeated dose treatment with placebo.

Arm type	Experimental
Investigational medicinal product name	FE 203799
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

The subjects were to receive a subcutaneous dose of 5 mg FE 203799 once weekly for 4 weeks followed by a washout period of 6-10 weeks. The subjects crossed-over to receive subcutaneous placebo once weekly for 4 weeks followed by a washout period of 6-10 weeks.

Arm title	Placebo crossover to FE 203799
------------------	--------------------------------

Arm description:

Repeated dose treatment with placebo followed by cross-over to repeated dose treatment with FE 203799.

Arm type	Experimental
Investigational medicinal product name	FE 203799
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

The subjects were to receive subcutaneous placebo once weekly for 4 weeks followed by a washout period of 6-10 weeks. The subjects crossed-over to receive a subcutaneous dose of 5 mg FE 203799 once weekly for 4 weeks followed by a washout period of 6-10 weeks.

Number of subjects in period 1	FE 203799 crossover to placebo	Placebo crossover to FE 203799
Started	4	4
Completed	4	4

Period 2

Period 2 title	Open-label extension
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

Not blinded.

Arms

Arm title	FE 203799 open-label extension
------------------	--------------------------------

Arm description:

Repeated dose treatment with FE 203799.

Arm type	Experimental
Investigational medicinal product name	FE 203799
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

The subjects were to receive a subcutaneous dose of 10 mg FE 203799 once weekly for 4 weeks.

Number of subjects in period 2	FE 203799 open-label extension
Started	8
Completed	7
Not completed	1

Primary: Adverse events

End point title	Adverse events ^[1]
End point description: Number of subjects with adverse events.	
End point type	Primary
End point timeframe: Treatment emergent adverse events were defined as those with onset on or after the day of the first IMP administration until the end-of-trial visit.	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical comparisons of adverse event incidence rates between the reporting groups were performed.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse events (AE) s were recorded from screening until the final visit 4-6 weeks after the last dose.

Adverse event reporting additional description:

An AE having onset on or after the day of the first administration of trial drug was considered treatment emergent. Adverse events were reported for the safety analysis set, comprising all subjects who received a treatment injection at least once.

Assessment type	Systematic

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
09 April 2018	The dose was reduced from 25 mg to 5 mg for the cross-over trial (equal to part A, introduced in amendment 2), to change the approach for the first dosing in patients to a lower dose, which would be optimal for a first-in-patient study, avoiding exposure of patients to potentially unnecessary elevated concentrations of the active compound. The change was based on thorough analyses of older and recent pharmacology data collected in preclinical studies which suggested that a lower dose of FE 203799, such as 5 mg, could also show pharmacological activity.
28 August 2018	<p>The trial was extended from the initial part A (randomised, double-blind, 2-period cross-over) to also include the open label, dose ranging part B in order to enable dose exploration of FE 203799 beyond 5 mg once weekly. Due to the PK/PD profile of FE 203799 (with a half-life of 30 hours) early exploration of dose ranging was justified to adequately determine the risk/benefit of the future recommended dose and/or dose regimen (once weekly and/or every second week) and to guide the dose rationale for future pivotal clinical trials in the SBS population. The introduction of a part B enabled continued open label dose exploration of FE 203799 within the acceptable dose range defined by the no observed adverse effect level (NOAEL) derived from the toxicology studies (rats and minipigs exposed up to 13 weeks) and the phase 1 trials.</p> <p>It was defined that the sponsor's decision on dose escalation to 10 mg or de-escalation to 2.5 mg in part B of the trial would be based on a recommendation from the DMC after review of safety data from a minimum of 4 patients from this trial or another trial actively recruiting patients with SBS (protocol GLY-321-2017).</p> <p>The title of the trial, the trial design figure, the schedule of procedures, and the text in relevant sections of the protocol were updated to describe a third treatment period to test a single dose of FE 203799, which was to be identical to treatment period 1 and 2 and to take place following a 6 to 10 week washout period after the last dose in treatment period 2.</p> <p>The statistical section was updated to include how to analyse data from part B. It was stated that parts A and B of the trial were to be analysed and reported separately.</p>
22 November 2018	<p>The possibility to conduct interim analyses during the trial, if deemed necessary by the sponsor, was introduced. It was stated that any potential influence of interim analysis on the continued study conduct would be minimised by appropriate measures.</p> <p>The sponsor of the trial was changed from GLyPharma Therapeutic Inc. to GLyPharma Therapeutic Inc. (a wholly owned subsidiary of Therachon AG, Aeschenvorstadt 36, CH-4051 Basel Switzerland). Consequently, the sponsor medical officer and list of trial personnel were changed.</p> <p>An additional laboratory was included in order to analyse all exploratory biomarkers.</p> <p>It was clarified that safety case reports would be made accessible to specified, potentially unblinded sponsor personnel, who in case of being unblinded would not take any part in the operational activities.</p> <p>Clarifications related to the introduction of part B in protocol amendment 2 were made to the text.</p> <p>It was deleted that parts A and B of the trial were to be analysed separately.</p>

07 March 2019	<p>Inclusion criterion number 9 was added, stating that male patients had to use barrier contraception during the trial and for 2 weeks after the end-of-trial visit. By error, an inclusion criterion for male contraception had not been included in the original protocol, although it had been included in the patient information sheet and male patients had been informed about this requirement from the start.</p> <p>Exclusion criterion number 17 was changed so that only patients with changes in the listed treatments within 3 months of screening were to be excluded from the protocol. The original protocol stated that patients using systemic corticosteroids, methotrexate, cyclosporine, tacrolimus, sirolimus, infliximab, or other biologic therapy/immune modifiers within 30 days of screening were to be excluded from the protocol. A common cause of SBS is intestinal resection due to IBD, and consequently SBS patients may receive systemic immune modifiers as IBD treatment. Recent changes in these medications could indicate active disease, while patients that have been on stable treatment for at least 3 months were considered stable and could therefore be included in the protocol.</p> <p>Replacement of patients was changed so that patients not completing part B would also be replaced, so that 8 patients should complete part B.</p> <p>An inconsistency around the wording about FSH testing was addressed so that it was clear that the FSH test should only be used where there was doubt about the patient's menopausal status.</p>
27 June 2019	<p>A change in the company that owns the sponsor, GLyPharma Therapeutic Inc., from Therachon AG to VectivBio Holding AG.</p> <p>A change of company name of one of the analysis laboratories.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
