

Clinical trial results:

A Phase II, open label, dose escalation study to investigate the pharmacokinetics, pharmacodynamics, safety and clinical activity of beigelomab as an initial treatment of acute Graft-versus-Host Disease in combination with standard steroid therapy

Summary

EudraCT number	2017-002715-34
Trial protocol	IT
Global end of trial date	29 July 2022

Results information

Result version number	v1 (current)
This version publication date	14 April 2023
First version publication date	14 April 2023

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-001744-PIP01-14
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	15 February 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	08 July 2022
Global end of trial reached?	Yes
Global end of trial date	29 July 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The objectives of the trial will be:

- to establish the optimal biological dose (OBD) of intravenously infused begelomab in terms of modulation of CD26/CD3 lymphocyte activity;
- to investigate efficacy endpoints;
- to investigate the pharmacokinetics and pharmacodynamics of begelomab following escalating multiple doses of begelomab;
- to investigate the safety and tolerability of multiple doses of begelomab in patients with acute Graft-versus-Host Disease.

Protection of trial subjects:

The study was planned to comprise up to four dose levels in the dose escalation phase; only two additional dose levels were necessary to reach the Optimal Biological Dose (OBD). The starting dose level was 4 mg/m², the second dose level 8 mg/m² and the third dose level was 16 mg/m². At the end of the dose escalation phase, the data from all cohorts was analysed to determine the optimal biologically active dose for further evaluation in the extended cohort.

Prior to each dose escalation, the Trial Steering Committee (TSC) has met to review all available safety, tolerability, Pharmacokinetic (PK) and Pharmacodynamic (PD) data. A decision to escalate the dose could only be made when none of the dose escalation stopping criteria are expected to be met at the next higher dose level.

A minimum of four evaluable subjects from each cohort were needed to reach a dose escalation decision.

Background therapy:

Alongside the study treatments, methylprednisolone intravenous (IV) at the dose of ≤2 mg/kg/day (or other steroid and dose equivalent) was administered to subjects as baseline therapy.

Evidence for comparator: -

Actual start date of recruitment	05 September 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Italy: 50
Worldwide total number of subjects	50
EEA total number of subjects	50

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	3
Adults (18-64 years)	38
From 65 to 84 years	9
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study was divided in two phases. At initial stage, up to 6 patients per cohort were enrolled into sequential cohorts receiving increasing multiple doses of begelomab. Only two additional dose levels were necessary in order to reach the OBD. At the second stage, 25 additional patients were enrolled and treated at the OBD.

Pre-assignment

Screening details:

Patient who underwent allogeneic HSCT who developed clinical manifestations compatible with aGvHD were considered for enrolment, provided they have not been treated with Corticosteroids or other aGvHD therapies and had aGvHD grade greater than 2.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	begelomab 4 mg/m ² FAS

Arm description:

In the first stage of the study (dose escalation phase) patients were treated until achievement of the OBD. The first dose level was 4mg/m².

Arm type	Experimental
Investigational medicinal product name	begelomab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Infusion

Dosage and administration details:

The investigational medicinal product was administered as a 1-hour intravenous infusion into a central vein via a dedicated catheter (i.e. CVC or PICC) once daily for five days after enrolment (Days 1-5) followed by administration every other day for another eleven doses (Days 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27) for a total of 16 doses. First day of treatment is defined as Day 1.

Arm title	begelomab 8 mg/m ² FAS
------------------	-----------------------------------

Arm description:

In the first stage of the study (dose escalation phase) patients were treated until achievement of the OBD. The second dose level was 8mg/m².

Arm type	Experimental
Investigational medicinal product name	begelomab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Infusion

Dosage and administration details:

The investigational medicinal product was administered as a 1-hour intravenous infusion into a central vein via a dedicated catheter (i.e. CVC or PICC) once daily for five days after enrolment (Days 1-5) followed by administration every other day for another eleven doses (Days 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27) for a total of 16 doses. First day of treatment is defined as Day 1.

Arm title	begelomab 16 mg/m ² FAS
------------------	------------------------------------

Arm description:

In the first stage of the study (dose escalation phase) patients were treated until achievement of the OBD. The third dose level was 16mg/m². OBD has been reached at this dose level, therefore the second stage of the study (dose expansion phase) has been performed at the same dose level.

Arm type	Experimental
Investigational medicinal product name	begelomab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Infusion

Dosage and administration details:

The investigational medicinal product was administered as a 1-hour intravenous infusion into a central vein via a dedicated catheter (i.e. CVC or PICC) once daily for five days after enrolment (Days 1-5) followed by administration every other day for another eleven doses (Days 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27) for a total of 16 doses. First day of treatment is defined as Day 1.

End point description:

Dose of beigelomab leading to a maximum Receptor Occupancy as determined with flow cytometry

End point type	Primary
----------------	---------

End point timeframe:

Day -1 to Day 180, only day 28 reported

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Appropriate descriptive statistics has been used for outcome variables. Continuous variables has been presented using the mean, median, standard deviation, minimum and maximum, and were also discretized for practical purposes. For categorical data, frequencies and percentages were presented.

Secondary: Duration of Overall Response

End point title	Duration of Overall Response ^[2]
End point description: Defined as the time in days from first response (from Day 28) until GvHD progression or death	
End point type	Secondary
End point timeframe: Day 28 to Day 180	

Notes:

[2] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: Duration of overall response is defined as the time from first response until GvHD progression or death and it is calculated only for patients with disease progression or death. In the "begelomab 4 mg/m² FAS" and "4mg/m² Per Protocol" groups no patients progressed or died, therefore it is not possible to calculate the endpoint, which is reported as missing in the tables. System only allows to enter numbers in the field, therefore it was decided to exclude groups as "NA" is not reportable.

Reporting groups

Reporting group title	begelomab 4 mg/m ² FAS
-----------------------	-----------------------------------

Reporting group description:

In the first stage of the study (dose escalation phase) patients were treated until achievement of the OBD. The first dose level was 4mg/m².

The investigational medicinal product was administered as a 1-hour intravenous infusion into a central vein via a dedicated catheter (i.e. CVC or PICC) once daily for five days after enrolment (Days 1-5) followed by administration every other day for another eleven doses (Days 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27) for a total of 16 doses.

Reporting group title	begelomab 8 mg/m ² FAS
-----------------------	-----------------------------------

Reporting group description:

In the first stage of the study (dose escalation phase) patients were treated until achievement of the OBD. The second dose level was 8mg/m².

The investigational medicinal product was administered as a 1-hour intravenous infusion into a central vein via a dedicated catheter (i.e. CVC or PICC) once daily for five days after enrolment (Days 1-5) followed by administration every other day for another eleven doses (Days 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27) for a total of 16 doses.

Reporting group title	begelomab 16 mg/m ² FAS
-----------------------	------------------------------------

Reporting group description:

In the first stage of the study (dose escalation phase) patients were treated until achievement of the OBD. The third dose level was 16mg/m². OBD has been reached at this dose level, therefore the second stage of the study (dose expansion phase) has been performed at the same dose level.

The investigational medicinal product was administered as a 1-hour intravenous infusion into a central vein via a dedicated catheter (i.e. CVC or PICC) once daily for five days after enrolment (Days 1-5) followed by administration every other day for another eleven doses (Days 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27) for a total of 16 doses.

Serious adverse events	begelomab 4 mg/m ² FAS	begelomab 8 mg/m ² FAS	begelomab 16 mg/m ² FAS

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
21 May 2018	<p>Main changes include:</p> <ul style="list-style-type: none">- Updated staging system reference used for aGvHD and cGvHD determination- Inclusion/Exclusion criteria updated:<ul style="list-style-type: none">- Gastrointestinal biopsy is recommended and no longer mandatory- Time window for prior systemic corticosteroid therapy for GvHD has been extended to 48 hours- Spirometry test has been replaced by pulse oximetry assessment of oxygen saturation- Added criteria to exclude the possibility to enroll in the trial patients affected by steroid-resistant GvHD variant- Removed criteria "Patients with signs of steroid-resistance" due to the impossibility to diagnose steroid resistance within the first 48 hours after the start of systemic corticosteroid therapy- The definition of clinically relevant CMV-viremia has been updated according to the current clinical criteria for preemptive treatment and increased from ≥ 5.000 to ≥ 10.000 copies/mL in whole blood- To specify that both central venous catheter (CVC) and peripherally inserted central catheter (PICC) can be used for IP administration
07 January 2019	<p>Main changes include:</p> <ul style="list-style-type: none">- Study Phase changed from I-II to II, with rationale explanation in the study protocol- Inclusion/Exclusion Criteria updated:<ul style="list-style-type: none">- removed upper limit for inclusion age (previously < 70Yrs) since data on patients higher than 70 years can be relevant for safety purposes.- Time window for prior systemic corticosteroid therapy for GvHD has been extended to 72 hours to allow the sites more time to complete the screening exams and assessments.- The application of topical steroids for indications other than GvHD is no longer prohibited- Patients with known CNS involvement or pleural effusions/ascites are now eligible

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No
