EU Clinical Trials Register

Clinical trial results:

A Phase 3 Prospective, Randomized, Multicenter, Open-Label, Central Assessor-Blinded, Parallel Group, Comparative Study To Determine The Efficacy, Safety And Tolerability Of Aztreonam-Avibactam (ATM-AVI) ± Metronidazole (MTZ) Versus Meropenem± Colistin (MER±COL) For The Treatment Of Serious Infections Due To Gram Negative Bacteria, Including Metallo--Lactamase (MBL) – Producing Multidrug Resistant Pathogens, For Which There Are Limited Or No Treatment Options

Summary

EudraCT number	2017-002742-68
Trial protocol	HU CZ ES BG GR HR IT RO
Global end of trial date	23 February 2023

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 June 2023
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	23 February 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of ATM-AVI MTZ and MER COL at the Test of Cure (TOC) visit for the treatment of serious infections due to Gram-negative bacteria, including those due to MBL-producing MDR pathogens.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Council for Harmonization (ICH) Good Clinical Practice (GCP) Guidelines. All the local regulatory requirements pertinent to safety of trials subjects were followed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	05 April 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 2
Country: Number of subjects enrolled	Bulgaria: 8

Country: Number of subjects enrolled	Philippines: 5
Country: Number of subjects enrolled	Romania: 7
Country: Number of subjects enrolled	Russian Federation: 16
Country: Number of subjects enrolled	Spain: 51
Country: Number of subjects enrolled	Taiwan: 4

Country: Number of subjects enrolled	Türkiye: 25
Country: Number of subjects enrolled	Ukraine: 65
Country: Number of subjects enrolled	United States: 21
Worldwide total number of subjects	422
EEA total number of subjects	98

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	283
From 65 to 84 years	131
85 years and over	8

Subject disposition

Recruitment

Recruitment details:

Subjects who were hospitalized with a diagnosis of complicated intra-abdominal infection (cIAI) or nosocomial pneumonia (NP) including hospital-acquired pneumonia (HAP) and ventilator-associated pneumonia (VAP) were enrolled. This study was conducted across 20 countries from 05-Apr-2018 to 23-Feb-2023.

Pre-assignment

Screening details:

A total of 461 subjects were screened of which 38 failed screening and 1 subject was not randomized due to lack of study drug at the site. A total of 422 subjects were randomized in the study.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Aztreonam-avibactam ± Metronidazole

Arm description:

Subjects hospitalized with cIAI or NP (including HAP and VAP) were randomized to receive a loading dose of aztreonam-avibactam (ATM-AVI) by intravenous (IV) infusion over 30 minutes, immediately followed by an extended loading dose of ATM-AVI by IV infusion over 3 hours on Day 1. Subjects were administered a maintenance dose of ATM-AVI by IV infusion over 3 hours on Days 2 to 14. Subjects with cIAI also received metronidazole (MTZ) 500 milligrams (mg) IV every 8 hours.

Arm type	Experimental
Investigational medicinal product name	Azetronam
Investigational medicinal product code	PF-06947387
Other name	
Pharmaceutical forms	Powder for concentrate for dispersion for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Aztreonam 2 gm powder for concentrate for solution for infusion

Investigational medicinal product name	Metronidazole
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Metronidazole 500 mg/100 mL solution for infusion.

Investigational medicinal product name	Avibactam
Investigational medicinal product code	PF-06947387
Other name	
Pharmaceutical forms	Powder for concentrate for dispersion for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Avibactam 600 mg powder for concentrate for solution for infusion

Arm title	Meropenem± colistimethate

Arm description:

Subjects hospitalized with cIAI or NP (including HAP and VAP) were randomized to receive 1000 mg meropenem every 8 hours by IV infusion. A higher dose of 2000 mg was given by IV infusion over 180 minutes if carbapenem resistant pathogen was strongly suspected. Subjects were administered colistimethate sodium at investigator's discretion.

Arm type	Active comparator
Investigational medicinal product name	Colistimethate sodium
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Colistin 2 million International Units (IU) powder for solution for infusion. Colistimethate sodium equivalent to 150 mg colistin base activity per vial.

Investigational medicinal product name	Meropenem
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravesical use

Dosage and administration details:

Meropenem 1 g powder for solution for infusion

Number of subjects in period 1	Aztreonam-avibactam ± Metronidazole	Meropenem± colistimethate
Started	282	140
Subjects with cIAI	208 [1]	104 [2]
Subjects with HAP/VAP	74 [3]	36 [4]
Completed	242	122
Not completed	40	18
Consent withdrawn by subject	16	3
Physician decision	1	-
Adverse event, non-fatal	3	1
Death	17	11
Unspecified	2	2
Lost to follow-up	1	1

Notes:

[1] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.
Justification: This milestone includes only subjects with HAP/VAP.

[2] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.
Justification: This milestone includes only subjects with HAP/VAP.

[3] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that

completed, minus those who left.

Justification: This milestone includes only subjects with HAP/VAP.

[4] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: This milestone includes only subjects with HAP/VAP.

Primary: Percentage of Subjects With Clinical Cure at Test of Cure (TOC) Visit: Intent-To-Treat (ITT) Analysis Set

End point title	Percentage of Subjects With Clinical Cure at Test of Cure (TOC) Visit: Intent-To-Treat (ITT) Analysis Set

End point description:

Clinical cure was defined as improvement in baseline signs and symptoms such that after study treatment, no further antimicrobial treatment for the index infection (i.e., cIAI or HAP/VAP) was required. Additionally, for cIAI subjects, no unplanned drainage or surgical intervention was necessary since the initial procedure. Clinical cure was determined by the Independent Clinical Adjudication Committee. 95% confidence interval (CI) was based on Jeffrey's method. The ITT analysis set included all randomized subjects regardless of receipt of study drug.

End point title	Percentage of Subjects With Favorable per-Subject Microbiological Response at TOC Visit: Micro- ITT Analysis Set

End point description:

Subjects were determined to have a favorable microbiological response if all baseline pathogens for that subject had a favorable outcome (eradicated or presumed eradicated). Eradication: Absence of causative pathogen from an appropriately obtained specimen at the site of infection. Presumed eradication: repeat culture of specimens were not performed/clinically indicated in a subject who had a clinical response of cure. Micro-ITT analysis set was a subset of the ITT analysis and included all subjects who had at least 1 Gram-negative baseline pathogen from an adequate specimen obtained prior to the start of study treatment. Subjects with a per subject response of indeterminate were excluded from this analysis. Here, 'Number of Subjects Analyzed' signifies number of subjects evaluable for this endpoint.

End point type	Secondary

Secondary: Plasma Concentration of Aztreonam

End point title	Plasma Concentration of Aztreonam[1]

End point description:

Plasma concentration for aztreonam according to renal function (augmented, normal and mild, moderate and severe) is presented in this endpoint. Augmented = Creatinine clearance (CrCL) > 150 milliliters per minute (mL/min); Normal & Mild = CrCL > 50 to <=150 mL/min; Moderate = CrCL > 30 to ≤ 50 mL/min; Severe = CrCL > 15 to ≤ 30 mL/min. Pharmacokinetic (PK) analysis set included all subjects who had at least 1 plasma concentration data assessment available for ATM or AVI. All subjects reported under Number of Subjects Analyzed' contributed data to the table but may not have evaluable data for every category. Here, n= subjects evaluable for the specified category. 99999 signifies data could not be calculated due to insufficient number of subjects.

End point type	Secondary

End point timeframe:

Anytime between 25 to 30 minutes, 3.25 to 3.5 hours, 5.5 to 6.5 hours, 7.5 to 8.5 hours post start of infusion on Day 1; 2.75 to 3 hours, 3.5 to 4.5 hours, 5 to 6 and 7 to 8 hours post start of infusion on Day 4

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: This endpoint is specific to Aztreonam.

No statistical analyses for this end point

Other pre-specified: Percentage of Subjects With Clinical Cure at End of Treatment (EOT) Visit: ITT Analysis Set

End point title	Percentage of Subjects With Clinical Cure at End of Treatment

End point description:

Clinical cure was defined as improvement in baseline signs and symptoms such that after study treatment, no further antimicrobial treatment for the index infection (i.e., cIAI or HAP/VAP) was required. Additionally, for cIAI subjects, no unplanned drainage or surgical intervention was necessary since the initial procedure. Clinical cure was determined by the Independent Clinical Adjudication Committee. 95% CI was based on Jeffrey's method. The ITT analysis set included all randomized subjects regardless of the treatment received.

Other pre-specified: Percentage of Subjects With Clinical Cure at EOT Visit: CE Analysis Set

End point title	Percentage of Subjects With Clinical Cure at EOT Visit: CE Analysis Set

End point description:

Clinical cure = improvement in signs and symptoms after treatment, no further antimicrobial treatment for the index infection (i.e., cIAI or HAP/VAP) was required. For cIAI subjects, no unplanned drainage or surgical intervention was necessary since the initial procedure. Clinical cure was determined by the Independent Clinical Adjudication Committee. 95% CI was based on Jeffrey's method. CE analysis set: all subjects in ITT analysis set; met criteria for cIAI, or HAP/VAP; received at least 48 hours of study treatment or <48 hours of treatment before discontinuing study drug due to AE; no concomitant antibiotics for any baseline pathogens between first dose and TOC (except protocol-allowed antibiotics); no prior antibiotics other than allowed per protocol; no important protocol deviations; no clinical outcome of indeterminate at TOC; no monomicrobial infections due to non-eligible pathogens and did not have only Gram-positive pathogens.

Eradication: Absence of causative pathogen from specimen at the site of infection. Presumed eradication: repeat culture of specimens were not indicated in a subject who had a clinical response of cure. Percentage of Subjects with favorable per-subject microbiological response by pathogen resistance type (ATM and Meropenem non-susceptible based on EUCAST and CLSI criteria, ESBL-Positive, Carbapenemase and Serene Carbapenemase and Metallo-beta-lactamase-positive) is reported. Participants with per participant response of indeterminate were excluded from analysis. Micro-ITT analysis set was used. All subjects reported under 'Number of Subjects Analyzed' contributed data to the table but may not have evaluable data for every category. Here, n=number of subjects available for specified categories.

Other pre-specified: Duration of Mechanical Ventilation in HAP/VAP Subjects: CE Analysis Set

End point title	Duration of Mechanical Ventilation in HAP/VAP Subjects: CE Analysis Set

End point description:

Duration of mechanical ventilation was defined as the total number of calendar days on which the subject required mechanical ventilation from the date of randomization up to TOC. CE analysis set: all subjects in ITT analysis set; met criteria for cIAI, or HAP/VAP; received at least 48 hours of study

treatment or <48 hours of treatment before discontinuing study drug due to AE; no concomitant antibiotics for any baseline pathogens between first dose and TOC (except protocol-allowed antibiotics); no prior antibiotics other than allowed per protocol; no important protocol deviations; no clinical outcome of indeterminate at TOC; no monomicrobial infections due to non-eligible pathogens and did not have only Gram-positive pathogens. Here, 'Number of Subjects Analyzed' signifies subjects evaluable for this endpoint measure.

Other pre-specified: Number of Subjects With Unplanned Surgical Interventions in Complicated Intra-abdominal Infections (cIAI) Subjects: ITT Analysis Set

End point title	Number of Subjects With Unplanned Surgical Interventions in Complicated Intra-abdominal Infections (cIAI) Subjects: ITT Analysis Set

End point description:

Unplanned surgical interventions was defined as those occurring after the initial qualifying surgical intervention and prior to the TOC visit. Number of cIAI participants with unplanned surgical intervention according to clinical response categories of cure and failure is reported in this endpoint measure. The ITT analysis set included all randomized subjects regardless of receipt of study drug. All subjects reported under 'Number of Subjects Analyzed' contributed data to the table but may not have evaluable data for every category. Here, 'signifies= number of subjects available for specified categories.

Adverse events

Adverse events information

Timeframe for reporting adverse events:	
From start of study treatment until end of late follow-up visit (Up to Day 45)	
Adverse event reporting additional description:	
Data is presented for Safety analysis set.	
Assessment type	Non-systematic

Dictionary used

Dictionary name	MedDRA
Dictionary version	26.0

Reporting groups

Reporting group title	Meropenem

Reporting group description:

Subjects hospitalized with cIAI or NP (including HAP and VAP) were randomized to receive 1000 mg meropenem every 8 hours by IV infusion. A higher dose of 2000 mg was given by IV infusion over 180 minutes if carbapenem resistant pathogen was strongly suspected. Subjects were administered colistimethate sodium at investigator's discretion.

Reporting group title	ATM-AVI (+/-MTZ)

Reporting group description:

Subjects hospitalized with cIAI or NP (including HAP and VAP) were randomized to receive a loading dose of aztreonam-avibactam (ATM-AVI) by intravenous (IV) infusion over 30 minutes, immediately followed by an extended loading dose of ATM-AVI by IV infusion over 3 hours on Day 1. Subjects were administered a maintenance dose of ATM-AVI by IV infusion over 3 hours on Days 2 to 14. Subjects with cIAI also received metronidazole (MTZ) 500 milligrams (mg) IV every 8 hours.

Metabolism and nutrition disorders		
Hypokalaemia		
subjects affected / exposed	4 / 137 (2.92%)	16 / 275 (5.82%)
occurrences (all)	5	19

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
18 May 2022	Increased sample size, Updated Single Reference Safety Document and References list to reflect current and additional sources of study drugs or comparators. Updated risk/benefit language to replace "Drug induced liver injury" with "Increased liver transaminases" to be consistent with Investigator Brochure, Clarification to the study drug characteristics and on when ECG should be performed for both treatment arms.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Total number of deaths is reported for safety set under Adverse Events section. However, actual number of deaths were, for Aztreonam-avibactam ± Metronidazole 20 and Meropenem± colistimethate 11.

Notes:
