Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 July 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	27 October 2021
Global end of trial reached?	Yes
Global end of trial date	02 February 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Macular oedema is swelling of the retina at the back of the eye. It can cause vision loss and is a common complication in patients who have the eye condition uveitis (inflammation inside the eye). The MERIT Trial was designed to compare three treatments for uveitic macular oedema, to find out which intravitreal therapy offers the best balance of effectiveness and tolerability in eyes with controlled uveitis but persistent macular edema, specifically by comparing the relative efficacy and safety of intravitreal ranibizumab (Lucentis®) and intravitreal methotrexate to intravitreal dexamethasone implant (Ozurdex®) for the treatment of persistent uveitic macular oedema.

The primary outcome will be the percent change in macular thickness from the baseline to the 12 week visit.

Protection of trial subjects:

The injection procedures and treatment algorithm are consistent with standard clinical treatment, e.g., sterile technique, prophylactic pressure lowering medicine instilled prior to procedure. To minimize risks associated with increased ocular pressure post-injection, patients with uncontrolled ocular hypertension or glaucomatous changes are excluded from the trial. Pregnancy testing are required for women of childbearing potential before intravitreal injections of methotrexate or ranibizumab. Adverse events encountered will be managed by the best medical judgment of the treating physician.

Confidentiality of patient data is maintained in accordance with legal regulations. Protected health information is kept in a secure place. Name, social security number, address, and other such personal data are kept solely at the clinical center where the patient receives her/his clinical care. Such information will not be transmitted to the Coordinating Center or to other study sites. A dataset limited so as to contain a minimal amount of protected health information—that required to make the data useful for accomplishing the purposes of the trial may be disclosed, as needed, to collaborating study sites, the NEI, and the FDA, as will be stated on a study privacy acknowledgment form signed by the participant at the time of enrollment.. This privacy acknowledgment will be designed to conform to specifications of HIPAA regulations, and any other relevant regulations, as approved by the local governing authorities invested with oversight of HIPAA regulations at each participating site. Clinically relevant information from the study may be placed in the patient's medical record. Release of protected health information to any other persons or organizations will require additional written consent of the patient affected, except as required by law.

Background therapy: -

Evidence for comparator:

Recent pilot studies have shown intravitreal methotrexate (MTX) and intravitreal ranibizumab (Lucentis®, Genentech Inc., San Francisco, CA) to be promising treatments for uveitic ME, and intravitreal dexamethasone implant (Ozurdex®, Allergan, Irvine, CA) has recently been approved for uveitic ME in patients with non-infectious uveitis. In addition to being effective, intravitreal MTX and ranibizumab potentially may have less ocular side effects than corticosteroids, particularly less IOP elevation

Actual start date of recruitment	01 May 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 25
Country: Number of subjects enrolled	Canada: 8
Country: Number of subjects enrolled	Australia: 7
Country: Number of subjects enrolled	India: 27
Country: Number of subjects enrolled	United States: 127
Worldwide total number of subjects	194
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	132
From 65 to 84 years	62
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Screening details:

353 screened, 194 randomized

Excluded

Major reasons for exclusion were;

central subfield macular thickness within the normal range for the OCT machine (38%)

Patient preference (14%)

Uveitis (9%)

IOP issues (9%)

Period 1

Period 1 title	Overall trial 12 weeks (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

Reading center graders assessing primary outcome and visual acuity examiners masked to treatment

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Dexamethasone intravitreal implant 0.7mg
------------------	--

Arm description:

Dexamethasone intravitreal implant 0.7mg. Eligible eye(s) treated at study visit M01 (week 0).

Retreatment required at study visit M03 (8 weeks) if re-treatment criteria met.

Standard preparation as described for intravitreal injections.

(Ozurdex®, Allergan, Irvine, CA)

Arm type	Active comparator
Investigational medicinal product name	Ozurdex (0.7 mg dexamethasone pellet)
Investigational medicinal product code	
Other name	intravitreal dexamethasone pellet, Ozurdex
Pharmaceutical forms	Emulsion for injection
Routes of administration	Intraocular use

Dosage and administration details:

- Prepare eye for injection using the following sequence of steps:
 - Consider placing 2-3 drops of 5% povidone iodine in the lower fornix and/or using sterile cotton-tipped applicators soaked in 5% or 10% povidone iodine to swab the upper and lower eyelid margins and the upper and lower eyelashes (Optional)
 - Retract the eyelids and lashes away from the injection site and needle for the duration of the procedure (use of an eyelid speculum is optional)
 - Consider additional anesthesia with the application of one or two cotton-tipped applicators soaked in topical anesthetic over the intended injection site for at least 30 seconds. The use of lidocaine gel or other types of viscous anesthetic (e.g. TetraVisc™) is also permitted.
- A subconjunctival anesthetic can be used in specific circumstances in which the study ophthalmologist believes that topical anesthetic is not sufficient to minimize discomfort
- Remove the lid speculum/unretract eyelid and lashes and avoid any excess pre

Arm title	Intravitreal methotrexate 400µg in 0.1mL
------------------	--

Arm description:

Drug: Intravitreal Methotrexate 400 µg

Intravitreal Methotrexate 400 µg injection procedures should be carried out under controlled aseptic conditions which include the use of sterile gloves and a sterile eyelid speculum (or equivalent). Adequate anesthesia and a broad-spectrum microbicide such as betadine, applied to the periocular skin, eyelid and ocular surface are required prior to the injection.

Arm type	Active comparator
Investigational medicinal product name	Intravitreal methotrexate 400 µg in 0.1 mL
Investigational medicinal product code	
Other name	Intravitreal methotrexate 400 µg in 0.1 mL
Pharmaceutical forms	Emulsion for injection
Routes of administration	Intravitreal use

Dosage and administration details:

Intravitreal methotrexate 400 µg in 0.1 mL Eligible eye(s) treated M01+ Retreatment required at M02, M03 if retreatment criteria met Retreatment permitted at M04 and later if retreatment criteria met Retreatment criteria:

1. Central subfield thickness greater than 1.1 times the upper limit of normal (330 µm for Zeiss and Topcon SD OCT and 352 µm for Heidelberg OCT) and/or cystoid space(s) within 1 mm central subfield.
1. IOP of <25 mm Hg (treatment with ≤3 IOP-lowering agents permitted), IOP criteria for initial injection of study treatment in eligible eye(s) is ≤21 mm Hg with ≤3 IOP-lowering agents

Arm title	Intravitreal ranibizumab 0.5mg in 0.05mL
------------------	--

Arm description:

Intravitreal Ranibizumab 0.5 mg injection procedures should be carried out under controlled aseptic conditions which include the use of sterile gloves and a sterile eyelid speculum (or equivalent). Adequate anesthesia and a broad-spectrum microbicide such as betadine, applied to the periorcular skin, eyelid and ocular surface are required prior to the injection.

(Lucentis®, Genentech Inc., San Francisco, CA)

Eligible eye(s) treated at study visit M01 (week 0).

Retreatment required at study visit M03 (8 weeks) if re-treatment criteria met.

Retreatment permitted at later time points if retreatment criteria met.

Re-treatment criteria:

Central subfield thickness greater than 1.1X upper limit of normal (330 µm for Zeiss and Topcon Spectral Domain (SD) Optical Coherence Tomography (OCT) and 352 µm for Heidelberg OCT) and/or cystoid space(s) within 1 mm central subfield.

IOP of <25 mm Hg (treatment with ≤3 IOP-lowering agents permitted)

Minimum time between treatments: minimum

Arm type	Active comparator
Investigational medicinal product name	Intravitreal Ranibizumab (Lucentis) 0.5 mg in 0.05 mL
Investigational medicinal product code	
Other name	Lucentis
Pharmaceutical forms	Emulsion for emulsion for injection
Routes of administration	Intravitreal use

Dosage and administration details:

Intravitreal ranibizumab (Lucentis) 0.5 mg in 0.05 mL Eligible eye(s) treated M01+ Retreatment required at M02, M03 if retreatment criteria met Retreatment permitted at M04 and later if retreatment criteria met

Retreatment criteria:

- 1) Central subfield thickness greater than 1.1 times the upper limit of normal (330 µm for Zeiss and Topcon SD OCT and 352 µm for Heidelberg OCT) and/or cystoid space(s) within 1 mm central subfield.

Number of subjects in period 1	Dexamethasone intravitreal implant 0.7mg	Intravitreal methotrexate 400µg in 0.1mL	Intravitreal ranibizumab 0.5mg in 0.05mL

Primary: Proportion of Baseline Central Subfield Thickness Observed at 12 Weeks

End point title	Proportion of Baseline Central Subfield Thickness Observed at 12 Weeks
-----------------	--

End point description:

The primary outcome is the change in central subfield thickness from baseline to 12 weeks measured on a relative scale as the the proportion of the baseline central subfield thickness. Values less than 1 indicate a decrease in retinal thickness with lower values indicating greater decreases. Smaller values are better The assessment of OCT outcomes was performed by masked readers.

End point type	Primary
----------------	---------

End point timeframe:

The 12-week visit was chosen as the time to assess the primary outcome because the ranibizumab treatment arm specifies injections at baseline, 4 weeks and 8 weeks in all participants, and because the peak benefit for the dexamethasone pellet appears to be

-----------------------------------	------------------------------

Statistical analysis description:

Ozurdex (0.7 mg Dexamethasone Pellet) Delivered Via Intravitreal Injection, Intravitreal Ranibizumab (Lucentis) 0.5 mg in 0.05 mL

Comments

The treatment effect is the ratio of the proportions of baseline retinal thickness (Lucentis/Ozurdex) at 12 weeks. Values greater than 1 indicate less reduction in retinal thickness in the Lucentis treated group compared to Ozurdex estimated by a mixed model

Comparison groups	Macular edema eyes from Arm 1 (Ozurdex) v Macular edema eyes from Arm 3 Intravitreal Ranibizumab
Number of subjects included in analysis	146
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.12 ^[5]
Method	Mixed models analysis
Parameter estimate	Ratio of the proportion of baseline
Point estimate	1.22

Confidence interval	
level	95 %
sides	2-sided
lower limit	1.04
upper limit	1.43

Notes:

[5] - Bonferroni correction was used to adjust for the co-primary hypotheses;a two-sided type I error rate of $0.05/2 = 0.025$ was used to determine statistical significance for the two pairwise comparisons (Ozurdex vs Methotrexate and Ozurdex vs Lucentis)

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse events over 24 weeks

Adverse event reporting additional description:

Serious adverse events were reported via an expedited reporting system followed by medical safety review. Non-serious events collected in non-systemic means via an adverse event log that was completed at each visit and by systemic collection of information on ocular events of special interest on the follow up visit case reform forms.

Assessment type	Non-systematic
