

Clinical trial results:

One year study to evaluate the long-term safety and tolerability of dupilumab in pediatric patients with asthma who participated in a previous dupilumab asthma clinical study

Summary

EudraCT number	2017-003317-25
Trial protocol	Outside EU/EEA LT HU PL IT ES
Global end of trial date	01 April 2025

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-001501-PIP02-13
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	29 April 2025
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	01 April 2025
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Main study: To evaluate the long-term safety and tolerability of dupilumab in pediatric participants with asthma who participated in a previous dupilumab asthma clinical study EFC14153 (2016-001607-23).
Japan sub-study: To evaluate the efficacy of dupilumab in children 6 to <12 years of age with uncontrolled persistent asthma in the Japan sub-study.

Protection of trial subjects:

The study was conducted by investigators experienced in the treatment of pediatric participants. The parent(s) or guardian(s) as well as the children were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time. In addition to the consent form for the parent(s)/guardian(s), an assent form in child-appropriate language was provided and explained to the child. Repeated invasive procedures were minimized. The number of blood samples as well as the amount of blood drawn were adjusted according to age and weight. A topical anesthesia may have been used to minimize distress and discomfort.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	21 June 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	378
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The main study was conducted at 70 centers in 17 countries, and the sub-study was conducted at 11 centers in Japan. 365 participants who rolled over from parent study EFC14153 were enrolled in the main study and 13 participants (not included in parent study EFC14153) were enrolled in Japan sub-study.

Pre-assignment

Screening details:

All participants received dupilumab dose based on body weight in the main study and Japan sub-study. As pre-specified in the protocol and statistical analysis plan (SAP), the results are presented by study and treatment group, regardless of the dose regimen.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Main Study: Placebo-Dupilumab

Arm description:

Participants who received placebo matched to dupilumab in the parent study EFC14153 received dupilumab for 52 weeks in the main study as follows:

- 100 milligrams (mg) once every 2 weeks (q2w) as a subcutaneous (SC) injection or 300 mg once every 4 weeks (q4w) as an SC injection for participants with body weight ≤ 30 kilograms (kg).
- 200 mg q2w as an SC injection for participants with body weight > 30 kg.

Participants also received a stable-dose background therapy of medium-dose inhaled corticosteroids (ICS) with a second controller medication (i.e., long-acting beta-2 agonists [LABA], long-acting muscarinic antagonists [LAMA], leukotriene receptor antagonists [LTRA] or methylxanthines) or high-dose ICS alone or high-dose ICS with second controller medication. Albuterol/salbutamol or levalbuterol/levosalbutamol was given as reliever medication as instructed by Investigator.

Arm type	Experimental
Investigational medicinal product name	Dupilumab
Investigational medicinal product code	SAR231893
Other name	Dupixent, REGN668
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Dupilumab was administered as an SC injection at a dose 100 mg q2w or 300mg q4w for participants with body weight ≤ 30 kg and 200 mg q2w for participants with body weight > 30 kg for 52 weeks.

Arm title	Main Study: Dupilumab-Dupilumab
------------------	---------------------------------

Arm description:

Participants who received dupilumab in the parent study EFC14153 received dupilumab for 52 weeks in the main study as follows:

- 100 mg q2w as an SC injection or 300 mg q4w as an SC injection for participants with body weight ≤ 30 kg.
- 200 mg q2w as an SC injection for participants with body weight > 30 kg.

Participants also received a stable-dose background therapy of medium-dose ICS with a second controller medication (i.e., LABA, LAMA, LTRA or methylxanthines) or high-dose ICS alone or high-dose ICS with second controller medication. Albuterol/salbutamol or levalbuterol/levosalbutamol was given as reliever medication as instructed by Investigator.

Primary: Main Study: Number of Participants With Any Treatment-Emergent Adverse Events (TEAEs)

End point title	Main Study: Number of Participants With Any Treatment-Emergent Adverse Events (TEAEs) ^{[1][2]}
-----------------	---

End point description:

An adverse event (AE) was any untoward medical occurrence in a participant or clinical investigation participant administered a pharmaceutical product and which did not necessarily have to have a causal relationship with this treatment. TEAEs were AEs that developed or worsened or became serious during the TEAE period. Safety population included all participants exposed to at least 1 dose or part of a dose of the study treatment during current study regardless of the amount of treatment administered.

End point type	Primary
----------------	---------

End point timeframe:

From first dose of study treatment (Day 1) up to 112 days post last dose of study treatment, approximately 64 weeks

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: As the endpoint is descriptive in nature, no statistical analysis is provided.

[2] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Only participants in the Main study arms were analyzed in this endpoint.

Primary: Japan Sub-study: Change From Baseline to Week 12 in Pre-Bronchodilator Percent Predicted Forced Expiratory Volume in 1 Second (FEV1)

End point title	Japan Sub-study: Change From Baseline to Week 12 in Pre-Bronchodilator Percent Predicted Forced Expiratory Volume in 1 Second (FEV1) ^{[3][4]}
-----------------	--

End point description:

FEV1 was the volume of air (in liters) exhaled from the lungs in the first second of a forced expiration as measured by spirometer. Spirometry was performed after a wash out period of bronchodilators according to their action duration. Baseline was defined as the last available measurement prior to the first study treatment dose if the participant was treated, or the last available value up to enrollment if the participant was not exposed to study treatment in the current study. Intent-to-treat (ITT) population included all participants in the enrolled population in the current study.

End point type	Primary
----------------	---------

Secondary: Annualized Rate of Severe Asthma Exacerbation Events During the 52-

Week Treatment Period

End point title	Annualized Rate of Severe Asthma Exacerbation Events During the 52-Week Treatment Period
-----------------	--

End point description:

A severe exacerbation event during study was defined as a deterioration of asthma requiring use of systemic corticosteroid (SCS) for ≥ 3 days or hospitalization/emergency room visit because of asthma, requiring SCS. Annualized severe exacerbation event rate was defined as total number of events that occurred during 52-week treatment period divided by total number of participant-years followed in 52-week treatment period. Main study: safety population included all participants exposed to at least 1 dose or part of a dose of study treatment during current study regardless of amount of treatment administered. occurrences (all)	3	1	6

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
09 July 2018	Changed study sample size due to the increase in the sample size of EFC14153 (parent study of the LTS14424), removed secondary safety endpoint, removed optional pharmacogenetic informed consent/assent form mention, changed pregnancy outcome follow-up period, added LAMA and ultra LABA (vilanterol) withhold period before spirometry, included the total volume of blood collected at a single visit, corrected the information that data for current study Visit (V) 1 coming from end of treatment (EOT) visit from parent study would not be reported in current study electronic case report form.
12 December 2019	Changed dupilumab dose for children with body weight ≤ 30 kg from 100 mg q2w to 300 mg q4w, removed immunoglobulins as other secondary endpoints, clarified when an asthma exacerbation was to be reported as AE, added relatedness to study treatment in the adverse event of special interest anaphylactic reaction and systemic allergic reaction, clarified that hepatitis serologies were not repeated for determining participants' eligibility in the current study, changed study sample size, updated analysis populations according to the dose regimen, updated retention of study documents in study sites from 15 to 25 years.
15 April 2020	Allowed later entrance in current study for EFC14153 participants who were not able to perform the EFC14153 EOT visit onsite to rollover at V28/EOT, or to receive last study treatment doses in parent study EFC14153 due to the coronavirus disease 2019 pandemic, removed the monthly 300 mg dose specific analysis set, allowed at home administration of 300 mg monthly doses from the second administration onwards (following first 300 mg administered onsite).

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
