

Clinical trial results:

A phase 3 randomised, double blind, clinical trial investigating the effectiveness of repurposed simvastatin compared to placebo, in secondary progressive multiple sclerosis, in slowing the progression of disability

Summary

EudraCT number	2017-003328-56
Trial protocol	GB

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 October 2024
Is this the analysis of the primary completion data?	Yes
Primary completion date	26 July 2024
Global end of trial reached?	Yes
Global end of trial date	26 July 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective is to compare the effect of daily use simvastatin (80mg) versus placebo on disability progression at 6 monthly intervals in patients with Secondary Progressive MS (SPMS). Disability progression will be assessed based on change in Expanded Disability Status Scores (EDSS) compared to baseline.

The hypothesis is that repurposed simvastatin (80mg) is a disease modifying treatment for patients with SPMS.

Protection of trial subjects:

The trial was conducted in compliance with the approved protocol, UCL CCTU Standard Operating Procedures (SOPs), the Declaration of Helsinki (2008), the principles of Good Clinical Practice (GCP) as laid down by the Commission Directive 2005/28/EC with implementation in national legislation in the UK by Statutory Instrument 2004/1031 and subsequent amendments, the UK Data Protection Act, and the National Health Service (NHS) Research Governance Framework for Health and Social Care. The potential hepatic effects and risk of myopathy in simvastatin use and provision for stopping or modifying treatment if these events occurred were made in the trial protocol.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 November 2017
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 964
Worldwide total number of subjects	964
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23	0

months)	
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	932
From 65 to 84 years	32
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Participants were recruited from 31 neuroscience centres and district general hospitals in the UK.

The eligibility of each patient was reviewed on the observations and bloods taken for screening.

Pre-assignment

Screening details:

1079 participants were assessed for eligibility and 964 were randomised. The reasons for exclusions were: 94 ineligible, 16 patient choice and 5 unknown reason. Written informed consent to be was obtained, after explanation of the aims, methods, benefits and potential hazards of the trial and BEFORE any trial-specific procedures were performed.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Assessor

Blinding implementation details:

Participants and investigators, including pharmacy, treating and independent assessing neurologists, were masked to treatment allocation. To maintain masking, an online randomisation system was used. This issued a five-digit code to identify the concealed bottles of treatment (tablets of the same colour and size), either simvastatin or placebo, for the site pharmacy to dispense at each dosing visit according to the patient's allocation.

Arms

Are arms mutually exclusive?	Yes
Arm title	Simvastatin

Arm description:

Oral 80mg simvastatin (initially 40mg at randomisation, then escalated after 1 month if tolerated) taken once daily at night

Arm type	Experimental
Investigational medicinal product name	Simvastatin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Oral 80mg simvastatin (initially 40mg at randomisation, then escalated after 1 month if tolerated) taken once daily at night.

Arm title	Placebo
------------------	---------

Arm description:

Oral placebo (initially 1 capsule at randomisation, then escalated after 1 month to 2 capsules if tolerated), taken once daily at night.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo (1x tablet taken once daily at night for 1 month from Baseline (Month 0). Followed by Placebo (2x tablet taken once daily at night) for 35 months from Visit 3 (Month 1) to Visit 10 (Month 36). For

those patients who have not had a confirmed EDSS progression event by Visit 10 (Month 36), they will be invited to an additional 3 visits to Visit 13 (Month 54) to continue Placebo (2x tablet taken once daily at night).

Number of subjects in period 1	Simvastatin	Placebo
Started	482	482
Completed	425	412
Not completed	57	70
Consent withdrawn by subject	28	32
Unable to complete safety monitoring	1	6
Adverse event, non-fatal	14	14
Started contraindicated medication	-	1
Ill health	6	9
Safety concerns	3	1
Started statins	-	3
Died	5	4

End points

End points reporting groups

Reporting group title	Simvastatin
Reporting group description: Oral 80mg simvastatin (initially 40mg at randomisation, then escalated after 1 month if tolerated) taken once daily at night	
Reporting group title	Placebo
Reporting group description: Oral placebo (initially 1 capsule at randomisation, then escalated after 1 month to 2 capsules if tolerated), taken once daily at night.	
Subject analysis set title	Per-protocol high dose
Subject analysis set type	Per protocol
Subject analysis set description: Includes participants who complied with high dose treatment. Patients were considered compliant with their randomised intervention if they took the protocol dose on at least 90% of days over the first 3 years of follow-up, or until date of confirmed progression, death, or withdrawal if these happened before 3 years.	
Subject analysis set title	Per-protocol high/low dose
Subject analysis set type	Per protocol
Subject analysis set description: Includes participants who complied with high or low dose treatment. Patients were considered compliant with their randomised intervention if they took the either low (40mg/1 capsule) or high (80mg/2 capsules) dose on at least 90% of days over the first 3 years of follow-up, or until date of confirmed progression, death, or withdrawal if these happened before 3 years.	
Subject analysis set title	COVID-19 sensitivity analysis
Subject analysis set type	Sub-group analysis
Subject analysis set description: Participants were included where they were randomised before the start of COVID-19-related public health restrictions (before March 16, 2020) and attended an in-person visit at month 36 after the end of COVID-19 related public health restrictions in the UK (after July 19, 2021).	

Primary: Confirmed disability progression up to 4·5 years

End point title	Confirmed disability progression up to 4·5 years
End point description: The primary endpoint was confirmed disability progression up to 4·5 years. Progression of disability was defined as an increase of at least 1 point if EDSS score at baseline visit was less than 6·0, or an increase of 0·5 point if EDSS score at baseline visit was 6·0 or more. The initial disability progression event was finalised as a confirmed event if the increase in EDSS persisted to at the next visit at least 6 months later. The time of confirmed progression was defined as when the initial disability progression occurred.	
End point type	Primary
End point timeframe: Up to 4.5 years from randomisation

Statistical analyses

Statistical analysis title	Primary endpoint: confirmed disability progression
Statistical analysis description:	
The primary endpoint, confirmed disability progression on EDSS, was compared between the simvastatin and placebo treatment using a Cox proportional hazards model. The estimated hazard ratio (HR) along with its 95% confidence interval (CI) and Wald test p value was obtained. The model stratified by centre and adjusted for the other variables included in the minimisation process (sex, age, and baseline EDSS).	
Comparison groups	Simvastatin v Placebo
Number of subjects included in analysis	964
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.26 ^[1]
Method	Regression, Cox
Parameter estimate	Hazard ratio (HR)
Point estimate	1.13
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.91
upper limit	1.39

Notes:

[1] - Two-sided p-value from a Wald test against the null hypothesis that the hazard ratio is equal to 1

Statistical analysis title	Sensitivity analysis including unconfirmed events
Statistical analysis description:	
Simvastatin and placebo groups were compared using a Cox proportional hazards model that stratified by centre and adjusted for the other variables included in the minimisation process (sex, age, and baseline EDSS). In this analysis progression events were additionally included where participant ended follow-up before the event could be confirmed.	
Comparison groups	Simvastatin v Placebo

Secondary: Multicomponent disability progression

End point title	Multicomponent disability progression
End point description: Progression by 3 years on a multicomponent measure. Disability progression (and subsequently confirmed) on one or more of EDSS, timed 25-foot walk (T25FW), or the 9 hole peg test (9HPT). Progression on the EDSS was defined as a 0.5 point increase if baseline EDSS ≥ 6 or 1.0 point increase if baseline EDSS < 6 . Progression on the MSFC walk was defined as either: A) $\geq 20\%$ increase in average 25ft walk time; or B) becoming unable to complete either of the trials of the 25ft walk due to disability. Progression on the 9HPT was defined as either: A) $\geq 20\%$ decrease in the average 9HPT time; B) becoming unable to complete either of the right handed trials of the 9HPT; or C) becoming unable to complete either of the left handed trials of the 9HPT.	
End point type	Secondary
End point timeframe: Up to 3 years.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
24 January 2018	Protocol update to v2.0 - Introduced a new exclusion criterion to prevent enrolment of patients with rare hereditary lactose-related disorders, add formal trial identifiers, and implement two additional fatigue questionnaires across all sites. It also establish three optional sub-studies (MRI, biomarker, and OCT), permit recruitment of healthy blood donors for the biomarker sub-study, and update procedures for obtaining consent and reporting serious events, including pregnancy notifications by male participants. Additional changes include switching from ABILHAND-56 to ABILHAND-23, updating oversight committee terminology, adding glossary terms, and making minor edits and formatting improvements throughout the protocol.
02 August 2018	Protocol update to v3.0 - Introduced updated branding and GDPR references, simplified and clarified inclusion criteria, and made broad refinements across governance, secondary outcomes, participant timelines, assessments, and operational procedures. It clarified eligibility, data collection processes, safety reporting, handling of intervention adherence, and follow-up procedures. Extensive updates were also made to the MRI, biomarker, and OCT sub-studies, including added eligibility criteria, clarified outcomes, and the addition of a new ABILHAND-23 sub-study.
22 July 2019	Protocol update to v4.0 - Updated exclusion criteria to include elbasvir, grazoprevir, recent cladribine, and to specify dimethyl fumarate, and corrected the primary outcome to reflect change in EDSS from baseline. Terminology was standardised, and laboratory-related sections were revised to add information on myopathy and clarify dose-modification strategies. Further updates refined contraindicated medications, the definition of trial end, and guidance for SLCVA testing and participant timelines, including limiting the FAB to a sub-study at UCLH and revising safety blood requirements. Safety reporting procedures were clarified, including updates to AE/SAE criteria and use of CTCAE V5, and adjustments were made to responsibilities for assessing expectedness. Additional changes included updating site maps, correcting references, expanding biomarker storage plans, refining OCT sub-study assessments, and adding a new FAB sub-study appendix.
23 March 2020	Protocol update to v5.0 - Clarified the schedule for safety blood testing, specifying that assessments would occur at Month 1 (40 mg tolerance), Month 3 (80 mg tolerance), and then at least annually from Month 6 to Month 36. It stated that patients unable to attend the Month 3 high-dose assessment should be de-escalated to 40 mg and re-challenged later if clinically appropriate. Once stable on the 80 mg dose, annual testing was considered sufficient unless clinical need required more frequent monitoring. It also established that no additional IMP would be dispensed if more than 12 months had passed since the last safety blood evaluation.
11 August 2020	Protocol update to v6.0 - Clarified the minimum required interval since an MS relapse for eligibility and added Ticagrelor and Daptomycin as exclusion and contraindicated medications, with related updates to laboratory abnormality guidance and dose re-challenge procedures. It allowed, in exceptional circumstances such as COVID-19, the combining of screening and baseline visits and permitted the Month 1 visit to be conducted remotely. Guidance on loss to follow-up was expanded to include categories of participation, and the map of expected MS-STAT2 sites was updated.

17 February 2021	Protocol update to v7.0 - updated the structured summary, trial team details, abbreviations, glossary and trial diagrams to reflect new protocol processes and definitions. It redefined the trial aim to assess whether disability progression could be slowed over the treatment period (rather than 3 years as previously), and revised the primary and secondary objectives and outcomes to include the additional trial visits, including clarification of EDSS comparisons and a shift to analysing the proportion of progression events. The design was amended to allow 1–3 additional six-monthly visits after Month 36 for patients without a confirmed progression event, with accompanying updates to the treatment schedule, participant timeline and processes for determining whether additional visits were required. Sample size calculations were revised, reducing the target sample due to recruitment impacts, and statistical methods were updated, including a new censor point for the primary outcome and changes to secondary outcome modelling. Finally, the analysis population description was updated to confirm that adherence would be assessed until each patient's final visit.
26 February 2024	Protocol update to v8.0 - Updated the structured summary, staffing information, and background section to incorporate current prevalence data, cost estimates, limited UK use of Siponimod, and recent research on statin mechanisms. It removed the option for a 3–6-month confirmatory visit after an initial progression at Visit 10 so that all visits were treated consistently, as this had been updated within the previous amendment with the addition of visits 11-13, with corresponding wording removed across relevant sections. Additional detail was provided for secondary objectives, statistical subgroup analyses related to COVID-19, and outcome analysis methods, including corrections to terminology and clarification of health economic analyses. Expectations for in-person assessments at Baseline and Visit 10 were clarified, Figure 2 was updated to reflect final site selection, and the MRI sub-study was revised to include QSM and MTV advanced imaging techniques.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
