Primary: Part 1: Absolute Change From Baseline in Magnetic Resonance Imaging (MRI) Global Chest Score at Week 48

End point title	Part 1: Absolute Change From Baseline in Magnetic Resonance Imaging (MRI) Global Chest Score at Week 48
End point description: MRI scans assessed semi-quantitatively via a standardized chest MRI scoring system. Each subject had 6 lobes scored using 7 scoring parameters: 1) Bronchiectasis/wall thickening 2) Mucus plugging 3) Abscesses/sacculations 4) Consolidations 5) Special findings 6) Mosaic pattern 7) Perfusion abnormalities. For each of 7 parameter, there were scores of 6 lobes (score of each lobe : 0= normal value, 1 = <50% of lobe involved and 2 = >=50% of lobe involved). MRI global score was calculated as sum of parameters 1 to 7. MRI total score is ranged from 0-84. Higher score indicate more lobe involvement. Full Analysis Set (FAS) included all randomized subjects who carried the intended CF transmembrane conductance regulator gene (CFTR) allele mutation and received at least 1 dose of study drug in Part 1. Here "n" signifies those subjects who were evaluable at specified time points for each reporting group respectively.
