#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 June 2021
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 October 2020
Global end of trial reached?	Yes
Global end of trial date	30 June 2021
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

This study evaluated the safety, tolerability, and efficacy of the cytomegalovirus (CMV) vaccine (V160) administered in a 2-dose or 3-dose regimen to healthy seronegative women 16 to 35 years of age. Participants received blinded V160 on Day 1, Month 2, and Month 6 (3-dose regimen), V160 on Day 1 and Month 6 and placebo at Month 2 (2-dose regimen), or placebo on Day 1, Month 2, and Month 6, and were followed to approximately Month 24. The primary hypothesis of the study was that administration of a 3-dose regimen of V160 will reduce the incidence of primary CMV infection compared to placebo.

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	30 April 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 58
Country: Number of subjects enrolled	Canada: 316
Country: Number of subjects enrolled	Spain: 164
Country: Number of subjects enrolled	Finland: 400
Country: Number of subjects enrolled	Israel: 260
Country: Number of subjects enrolled	Russian Federation: 75
Country: Number of subjects enrolled	United States: 927
Worldwide total number of subjects	2200
EEA total number of subjects	564

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	53
Adults (18-64 years)	2147
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details: -

### Pre-assignment

Screening details:

A total of approximately 2100 participants were planned to be enrolled with 2200 participants actually randomized.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	V160 3-Dose Regimen

Arm description:

Participants received V160 vaccination by intramuscular (IM) injection on Day 1, Month 2, and Month 6.

Arm type	Experimental
Investigational medicinal product name	V160
Investigational medicinal product code	
Other name	Human cytomegalovirus vaccine
Pharmaceutical forms	Injection
Routes of administration	Intramuscular use

Dosage and administration details:

V160 was administered as a 0.5 mL (100 Units/0.5 mL dose with Merck aluminum phosphate adjuvant [MAPA], 4°C stable formulation) IM injection.

<b>Arm title</b>	V160 2-Dose Regimen
------------------	---------------------

Arm description:

Participants received V160 vaccination by IM injection on Day 1 and Month 6 and placebo at Month 2.

Arm type	Experimental
Investigational medicinal product name	V160
Investigational medicinal product code	
Other name	Human cytomegalovirus vaccine
Pharmaceutical forms	Injection
Routes of administration	Intramuscular use

Dosage and administration details:

V160 was administered as a 0.5 mL (100 Units/0.5 mL dose with Merck aluminum phosphate adjuvant [MAPA], 4°C stable formulation) IM injection.

<b>Arm title</b>	Placebo
------------------	---------

Arm description:

Participants received placebo by IM injection on Day 1, Month 2, and Month 6.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intramuscular use

Dosage and administration details:

Saline solution administered as a 0.5 mL IM injection

<b>Number of subjects in period 1</b>	V160 3-Dose Regimen	V160 2-Dose Regimen	Placebo

## End points

### End points reporting groups

Reporting group title	V160 3-Dose Regimen
Reporting group description:	Participants received V160 vaccination by intramuscular (IM) injection on Day 1, Month 2, and Month 6.
Reporting group title	V160 2-Dose Regimen
Reporting group description:	Participants received V160 vaccination by IM injection on Day 1 and Month 6 and placebo at Month 2.
Reporting group title	Placebo
Reporting group description:	Participants received placebo by IM injection on Day 1, Month 2, and Month 6.

### Primary: Number of Participants Who Became Infected With Wild-Type Cytomegalovirus Infection (CMVi) Starting at 4 Weeks Post Last Dose (V160 3-dose Regimen Group and Placebo Group)

End point title	Number of Participants Who Became Infected With Wild-Type Cytomegalovirus Infection (CMVi) Starting at 4 Weeks Post Last Dose (V160 3-dose Regimen Group and Placebo Group) <sup>[1]</sup>
-----------------	--

End point description:

CMVi was defined as the detection of wild-type CMV (non vaccine type) by polymerase chain reaction in a single saliva or urine sample in a previously CMV-uninfected participant. CMVi cases in the 3-dose regimen and placebo groups were reported and incidence rate (per 100 person-years) calculated based on follow-up time starting at 4 weeks post last dose (Month 7) through approximately Month 24 (or time point to reach required cases for assessment). The percent reduction in CMVi incidence rate in the 3-dose regimen group compared to the placebo group was assessed. Participants who were CMV seronegative at Day 1 and CMV negative by polymerase chain reaction (PCR) for nonvaccine strain virus from post Day 1 through Month 7, had received all 3 injections/vaccinations within the vaccination visit window, and did not have any deviations from protocol deemed to potentially interfere with the evaluation of efficacy or immune response to injection of V160.

End point type	Primary
----------------	---------

End point timeframe:

4 weeks post last vaccination (Month 7) up to ~Month 24

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: For this endpoint, V160 3-Dose regimen group and the placebo group were the only two arms being evaluated.

End point values	V160 3-Dose Regimen	Placebo

### **Primary: Number of Participants With Solicited Injection-site Adverse Events**

End point title	Number of Participants With Solicited Injection-site Adverse Events
-----------------	---

End point description:

An adverse event (AE) is any untoward medical occurrence in a participant, temporally associated with the use of study treatment, whether or not considered related to the study treatment. An AE can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a study treatment. Following

vaccination with V160 or placebo, the number of participants with solicited injection-site AEs was assessed. The analysis population included all randomized participants who received at least 1 injection of V160 or placebo, had safety follow-up data, and had been assigned to the treatment arm corresponding to the actual clinical material received.

End point type	Primary
End point timeframe:	
Up to 5 days after each vaccination

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

All-cause mortality and serious adverse events: Up to 24 months; Non-serious adverse events: Up to 14 days following any vaccination.

Adverse event reporting additional description:

The analysis population included all randomized participants who received at least 1 injection of V160 or placebo, had safety follow-up data, and had been assigned to the treatment arm corresponding to the actual clinical material received. The all-cause mortality analysis population included all randomized participants.

Assessment type	Systematic

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
20 September 2018	Updated protocol procedures for clarification.
11 June 2019	Updated congenital cytomegalovirus infection (cCMVi) case definition, clarified the infant sample collection strategy, and adjusted visit schedules to be more accommodating and maintain more contact with study participants.

Notes:

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
