Analysis stage	Final
Date of interim/final analysis	15 February 2021
Is this the analysis of the primary completion data?	No
<hr/>	
Global end of trial reached?	Yes
Global end of trial date	30 June 2020
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

With the overall objective of optimizing the dosing regimen of empirical piperacillin-tazobactam treatment in pediatric febrile neutropenia (FN), we investigated whether continuous piperacillin-tazobactam infusions provide antibiotic concentrations associated with maximal activity and optimal target attainment.

Protection of trial subjects:

The trial was conducted in accordance with the ethical standards described in the declaration of Helsinki. Approvals were obtained from the Central Denmark Region Committee on Health Research Ethics, the Danish Data Protection Agency and the Danish Medicines Agency. Written informed consent was obtained from both parents or legal guardians. Children aged 15 to 17 years were allowed to give written informed consent for themselves, in close collaboration with their parents or legal guardians.

Experienced nurses were handling the blood sampling and administration of study drug. Furthermore, all information regarding the trial was given by study nurses or doctors with large pediatric experience. Data was registered, saved and managed using REDCap (Research Electronic Data Capture), hosted at the Department of Clinical Medicine, Aarhus University. REDCap is a secure, web-based software platform designed to support data capture for research studies.

Background therapy:

As standard empirical therapy of pediatric FN, piperacillin-tazobactam (300 mg/kg/day) was prescribed as intermittent administration every eight hours by the treating physician. After study enrollment, the study participants received a piperacillin-tazobactam loading bolus (100 mg/kg) followed by continuous infusion of piperacillin-tazobactam (300 mg/kg/day) at a fixed rate over 24 hours by a CADD®-Solis VIP infusion pump. Blood sampling points covered peak concentration immediately after loading dose and prior to continuous infusion -initiation (2-30 minutes), distribution phase (0.5-1.5 hours), and C_{ss} (12-24 hours).

Evidence for comparator:

Consensual PK/PD targets required for maximum efficacy of β -lactams in critically ill and neutropenic children remain to be established. For piperacillin, antibacterial effect is attained with a free drug concentration above MIC for 40%–70% of the time. However, a growing body of evidence recommends the use of higher PK/PD targets of 100% fT>MIC or even up to 100% fT>4-6xMIC to maximize the bactericidal effect and compensate for the reduced immunological response and limited post-antibiotic effect in neutropenic patients. Subsequently, the following PK/PD targets were evaluated in this trial: (1) 100% fT>MIC and (2) 50% fT>4xMIC. Although these targets are considered quite stringent, several other studies also evaluated these targets, and they are increasingly used among critically ill and neutropenic patients.

The PK/PD targets were evaluated in relation to the piperacillin MIC spectrum of blood stream infections in children with cancer at our institution, and the EUCAST MIC breakpoint for *Pseudomonas aeruginosa* (16 mg/L). In terms of antimicrobial susceptibility, *P. aeruginosa* represents a worst-case scenario and an increase in resistant *P. aeruginosa* strains has been reported during the last decades. Accordingly, it is recommended that empirical management of pediatric FN contain antipseudomonal coverage.

Actual start date of recruitment	01 August 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	4
Children (2-11 years)	44
Adolescents (12-17 years)	28
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Study participants were recruited when they were admitted with FN and was prescribed piperacillin-tazobactam. Written informed consent was obtained from both parents or legal guardians. Children aged 15 to 17 years were allowed to give written informed consent for themselves, in close collaboration with their parents or legal guardians.

Pre-assignment

Screening details:

Medical assessment

Period 1

Period 1 title	Intervention (Overall study period) (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

OBS!!!!!! We have added an extra arm, due the system that can not manage single arm studies. The duplet arm contains identical information as the intervention arm. A total of 38 patients were included.

Arms

Are arms mutually exclusive?	Yes
Arm title	Total study population

Arm description:

Single-arm study

Arm type	Total study population
Investigational medicinal product name	Piperacillin-tazobactam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate and solvent for solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

As standard care, intravenous piperacillin-tazobactam was prescribed at 300 mg/kg/day and administered intermittently every eight hours. After study enrollment, eligible patients received an intravenous 2-5 minutes piperacillin-tazobactam loading dose of 100 mg/kg (not subtracted from the total daily dose) followed by continuous infusion of 300 mg/kg/day (piperacillin component, maximum of 16 000 mg/day) at a fixed rate over 24 hours.

A supplemental loading dose of 100 mg/kg (maximum four doses per day) was administered in case of a discontinued infusion for longer than 30 minutes.

--------------------	----------

Frequency threshold for reporting non-serious adverse events: 5 %

Notes:

[1] - There are no non-serious adverse events recorded for these results. It is expected that there will be at least one non-serious adverse event reported.

Justification: No non-serious adverse events were reported.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Samples were collected in blood, which may represent an imprecise surrogate of drug concentrations at the infective site. To allow a further refinement of the dosing regimen for the youngest children, this age group should contain more children.

Notes:
