

Clinical trial results:

A prospective, randomized, open-label, comparative study to assess the efficacy, safety and tolerability of aztreonam-avibactam (ATM-AVI) and best available therapy for the treatment of serious infections due to multi-drug resistant gram-negative bacteria producing metallo-lactamase (MBL)

Summary

EudraCT number	2017-004544-38
Trial protocol	GR RO
Global end of trial date	23 January 2023

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 June 2023
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	23 January 2023
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy, of aztreonam- avibactam (ATM- AVI) and best available therapy (BAT) at the Test of Cure (TOC) visit in the microbiological Intent- To-Treat (micro-ITT) population for the treatment of selected serious infections that are due to MBL-producing Gram-negative bacteria.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Council for Harmonization (ICH) Good Clinical Practice (GCP) Guidelines. All the local regulatory requirements pertinent to safety of trials subjects were followed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	25 December 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	China: 2
Country: Number of subjects enrolled	Greece: 3
Country: Number of subjects enrolled	India: 1
Country: Number of subjects enrolled	Malaysia: 2
Country: Number of subjects enrolled	Mexico: 1
Country: Number of subjects enrolled	Philippines: 1
Country: Number of subjects enrolled	Romania: 2
Country: Number of subjects enrolled	Russian Federation: 2
Country: Number of subjects enrolled	Thailand: 1
Worldwide total number of subjects	15
EEA total number of subjects	5

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	10
From 65 to 84 years	5
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Subjects hospitalized with a diagnosis of complicated intra-abdominal infection (cIAI), nosocomial pneumonia (NP) including hospital-acquired pneumonia (HAP) and ventilator-associated pneumonia (VAP), complicated urinary tract infection (cUTI), or bloodstream infections (BSI) due to producing Gram-negative bacteria were enrolled.

Pre-assignment

Screening details:

A total of 15 subjects signed the informed consent form and were randomized in the study. This study was conducted across 9 countries from 25 Dec-2020 to 23-Jan-2023. The study was terminated as recruitment of subjects with serious infections caused by gram-negative bacteria producing MBL was challenging.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Aztreonam- Avibactam (ATM- AVI)

Arm description:

Subjects were administered a loading dose of aztreonam- avibactam (ATM-AVI) by intravenous (IV) infusion over 30 minutes immediately followed by an extended loading dose of ATM-AVI by infusion over 3 hours, and then started a maintenance dose of ATM-AVI by IV infusion over 3 hours on Day 1. Subjects with creatinine clearance >50 milliliters per minute (mL/min) and >30 to 50 mL per minute were administered maintenance dose once every 6 hours for maximum of 14 days. Subjects with creatinine clearance >15 to 30 mL/min were administered maintenance dose once every 8 hours for maximum of 14 days. Subjects with cIAI also received metronidazole (MTZ) 500 milligram (mg) every 8 hours by IV infusion over 60 minutes.

Arm type	Experimental
Investigational medicinal product name	Aztreonam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Aztreonam 2 gram powder concentrate for infusion.

Investigational medicinal product name	Metronidazole
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Metronidazole 500 mg/100 millilitre (mL) solution for infusion.

Investigational medicinal product name	Avibactam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Avibactam 600 milligrams (mg) powder concentrate for infusion.

Arm title	Best Available Therapy (BAT)
------------------	------------------------------

Arm description:

Subjects who were hospitalized with a diagnosis of cIAI, NP, HAP, VAP, cUTI or BSI received Best Available Therapy (BAT) based upon site practice and local epidemiology for a maximum of 14 days. Subjects with cIAI in the BAT arm received metronidazole if BAT did not provide adequate anaerobic coverage.

Arm type	Active comparator
Investigational medicinal product name	BAT
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Based on investigative site practice and local epidemiology.

Number of subjects in period 1	Aztreonam- Avibactam (ATM- AVI)	Best Available Therapy (BAT)
Started	12	3
Treated	12	2
Completed	9	1
Not completed	3	2
Consent withdrawn by subject	1	1
Death	2	1

Baseline characteristics

Reporting groups

Subjects with cIAI also received metronidazole (MTZ) 500 milligram (mg) every 8 hours by IV infusion over 60 minutes.	
Reporting group title	Best Available Therapy (BAT)
Reporting group description: Subjects who were hospitalized with a diagnosis of cIAI, NP, HAP, VAP, cUTI or BSI received Best Available Therapy (BAT) based upon site practice and local epidemiology for a maximum of 14 days. Subjects with cIAI in the BAT arm received metronidazole if BAT did not provide adequate anaerobic coverage.	

Primary: Percentage of Subjects With Clinical Cure at the Test of Cure (TOC) Visit - Microbiological Intent to Treat (Micro-ITT) Analysis Set

End point title	Percentage of Subjects With Clinical Cure at the Test of Cure (TOC) Visit -Microbiological Intent to Treat (Micro-ITT) Analysis Set ^[1]
End point description: Clinical cure was defined as improvement in baseline signs and symptoms such that no further antimicrobial treatment was required for the index infection (i.e., cIAI, cUTI, HAP/VAP or BSI) after study treatment. Also for cIAI subjects, no unplanned drainage or surgical intervention was necessary since the initial procedure. The clinical response assessment was determined by a blinded independent adjudication committee. 95% confidence interval (CI) was calculated using Jeffrey's method. Micro-ITT analysis set was a subset of the ITT analysis set and included all subjects who had at least 1 MBL-positive Gram-negative baseline pathogen from an adequate specimen at the start of study treatment. 99999 indicates data could not be calculated due to insufficient number of subjects.	
End point type	Primary
End point timeframe: Day 28	
Notes: [1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point. Justification: No statistical analysis was planned for this endpoint

End point title	Percentage of Subjects With a Favorable Per Subject Microbiological Response at EOT Visit-Micro-ITT Analysis Set
-----------------	--

End point description:

Favorable microbiological response was defined as eradication or presumed eradication. Eradication was defined as absence (or urine quantification $<10^3$ colony forming units per milliliter [CFU/mL] for cUTI subjects) of causative pathogen from an appropriately obtained specimen at the site of infection. Presumed eradication was defined as repeat culture of specimens were not performed/clinically indicated in a subject who had a clinical response of cure (specific to cIAI and HAP/VAP subjects). Micro-ITT analysis set was a subset of the ITT analysis set and included all subjects who had at least 1 MBL-positive Gram-negative baseline pathogen from an adequate specimen at the start of study treatment. Subjects with a per subject response of Indeterminate were excluded from this analysis. Here 'Number of Subjects Analyzed' signifies subjects evaluable for this endpoint.

Secondary: Number of Subjects With Treatment Emergent Adverse Events and Serious Adverse Events

End point title	Number of Subjects With Treatment Emergent Adverse Events and Serious Adverse Events
-----------------	--

End point description:

An adverse event (AE) was any untoward medical occurrence in a study subject administered a product or medical device; the event need not necessarily have a causal relationship with the treatment or usage. A serious adverse event (SAE) was any untoward medical occurrence at any dose that: resulted in death; was life-threatening (immediate risk of death); required inpatient hospitalization or prolongation of existing hospitalization; resulted in persistent or significant disability/ incapacity; resulted in congenital anomaly/birth defect; considered an important medical event. Treatment-emergent adverse event (TEAE) was any AE that started after the study medication start date and time. Safety analysis set included all subjects who received any amount of study treatment. Subjects were analysed according to the treatment they received.

Secondary: Number of Subjects With Vital Sign Abnormalities

End point title	Number of Subjects With Vital Sign Abnormalities
-----------------	--

End point description:

Vital signs included blood pressure and heart rate and were measured in a supine position after at least 10 minutes of rest for the subjects. Criteria for vital sign abnormalities included: systolic blood pressure (SBP): value >150 millimeters of mercury (mmHg) and increase from baseline ≥ 30 mmHg and value <90 and decrease from baseline ≥ 30 . Diastolic BP (DBP) (mm Hg) Value >100 and increase from baseline ≥ 20 and Value <50 and decrease from baseline ≥ 20 . Heart Rate (beats per minute [BPM]) Value <40 or >120. Safety analysis set included all subjects who received any amount of study treatment. Subjects were analyzed according to the treatment they received. Here 'Number of Subjects Analysed' signifies subjects evaluable for this endpoint.

Secondary: Number of Subjects With Abnormal Physical Examination Findings

End point title	Number of Subjects With Abnormal Physical Examination Findings
-----------------	--

End point description:

Physical examination included assessment of the following: abdomen, cardiovascular, ears, eyes, general appearance, head, lungs, lymph nodes, musculoskeletal, neurological, nose, skin and throat. Number of subjects with abnormal physical examination findings for each body system is reported in this outcome measure. Safety analysis set included all subjects who received any amount of study treatment. Subjects were analyzed according to the treatment they received. Here, 'Number Analyzed'= subjects evaluable for specified rows.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From first dose of study drug up to the Last follow up visit (up to maximum of 45 days)

Adverse event reporting additional description:

Same event may appear as non-SAE and SAE, what is presented are distinct events. Event may be categorized as serious in 1 subject and as non-serious in another subject or 1 subject may have experienced both serious and non-serious event during study. Analysis was performed on safety population.

Assessment type	Non-systematic

Reporting groups

Reporting group title	Best Available Therapy (BAT)
-----------------------	------------------------------

Reporting group description:

Subjects who were hospitalized with a diagnosis of cIAI, NP, HAP, VAP, cUTI or BSI received Best Available Therapy (BAT) based upon site practice and local epidemiology for a maximum of 14 days. Subjects with cIAI in the BAT arm received metronidazole if BAT did not provide adequate anaerobic coverage.

Reporting group title	Aztreonam- Avibactam (ATM- AVI)
-----------------------	---------------------------------

Reporting group description:

Subjects were administered a loading dose of aztreonam- avibactam (ATM-AVI) by intravenous (IV) infusion over 30 minutes immediately followed by an extended loading dose of ATM-AVI by infusion over 3 hours, and then started a maintenance dose of ATM-AVI by IV infusion over 3 hours on Day 1. Subjects with creatinine clearance >50 milliliters per minute (mL/min) and >30 to 50 mL per minute were administered maintenance dose once every 6 hours for maximum of 14 days. Subjects with creatinine clearance >15 to 30 mL/min were administered maintenance dose once every 8 hours for maximum of 14 days. Subjects with cIAI also received metronidazole (MTZ) 500 milligram (mg) every 8 hours by IV infusion over 60 minutes.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
23 May 2022	Amendment 2.0: Updated section 4: Study eligibility criteria to better reflect the target patient population in clinical practice.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Total number of deaths is reported for safety set under Adverse Events section. Actual number of deaths were 2 for Aztreonam-Avibactam and 1 for Best Available Therapy for ITT population as well.

Notes:
