

Clinical trial results:

A PILOT, PHASE II STUDY WITH A PROSPECTIVE, RANDOMIZED, CROSS-OVER, PLACEBO-CONTROLLED, DOUBLE-BLIND DESIGN TO ASSESS THE SHORT-TERM EFFECTS OF TOLVAPTAN PLUS PLACEBO VS TOLVAPTAN PLUS OCTREOTIDE LAR COMBINATION THERAPY IN ADPKD PATIENTS WITH NORMAL KIDNEY FUNCTION OR HYPERFILTRATION

Summary

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	20 October 2022
Is this the analysis of the primary completion data?	Yes
Primary completion date	08 April 2022
Global end of trial reached?	Yes
Global end of trial date	08 April 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the effect of 4-week Tolvaptan and Octreotide LAR combination therapy as compared to Tolvaptan and Placebo combination therapy on GFR, as assessed by the Iohexol Plasma Clearance Technique, in 20 ADPKD patients with normal kidney function (GFR: >80 and <120 ml/min/1.73m²) or hyperfiltration (GFR >120 ml/min/1.73m²).

Protection of trial subjects:

This study was conducted in conformance with the Declaration of Helsinki, Good Clinical Practice standards, and applicable country regulations regarding ethical committee review, informed consent, protection of human subjects participating in biomedical research, and privacy.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 June 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Italy: 19
Worldwide total number of subjects	19
EEA total number of subjects	19

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	19

From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Overall, 75 potentially eligible patients were identified and referred to the Clinical Research Center: 34 signed the written informed consent to study participation. Then, 22 eligible patients entered the run-in phase between January 22, 2019, and July 2, 2021 and 20 were finally randomized: ten to each treatment sequence.

Pre-assignment

Screening details:

Potentially eligible patients were identified from the database of the ADPKD Outpatient Clinics of the Unit of Nephrology of the ASST and were referred to the Clinical Research Center for Rare Diseases Aldo e Cele Daccò of the Istituto di Ricerche Farmacologiche Mario Negri IRCCS in Ranica (Italy).

Period 1

Period 1 title	First treatment period
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Arms

Arm title	Tolvaptan-Placebo
-----------	-------------------

Arm description:

All patients received a first 4-week treatment period with tolvaptan. Tolvaptan was started at the dose of 45 mg in the morning and 15 mg in the afternoon. Then, morning and afternoon doses were up-titrated every 2 days to 60 and 30 mg and then to 90 and 30 mg, respectively, according to tolerability. By completion of this 4-week titration period, participants were randomly allocated using a 1:1 randomization ratio to 4-week treatment periods with tolvaptan. During these two treatment periods, tolvaptan was administered at the maintenance dose achieved at the end of the titration period. According to the randomization plan, at the start of one of the two treatment periods, tolvaptan was combined with two 20-mg i.m. injections of octreotide- LAR, whereas at the start of the other treatment period, tolvaptan was combined with two i.m. injections of 0.9% NaCl solution (placebo for octreotide-LAR).

Arm type	Placebo
Investigational medicinal product name	0.9% NaCl
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

Two i.m. injections of 0.9% NaCl solution (placebo for octreotide-LAR).

Investigational medicinal product name	Tolvaptan
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

All patients received a first 4-week treatment period with tolvaptan. Tolvaptan was started at the dose of 45 mg in the morning and 15 mg in the afternoon. Then, morning and afternoon doses were up-titrated every 2 days to 60 and 30 mg and then to 90 and 30 mg, respectively, according to tolerability.

Number of subjects in period 1	Tolvaptan-Placebo
Started	19
Completed	19

Period 2

Period 2 title	Second treatment period
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Arms

Arm title	Tolvaptan-Octreotide LAR
------------------	--------------------------

Arm description:

Primary: Primary Comparison GFR

End point title	Primary Comparison GFR
End point description:	
The GFR was stable (Delta GFR: 0 [25 to 4] ml/min per 1.73 m ²) during the 1-month run-in period whereas it significantly decreased by 3 (21 to 5) ml/min per 1.73 m ² during the 1-month tolvaptan and placebo treatment period (P=0.01) and by 7 (3–14) ml/min per 1.73 m ² during the 1-month dual treatment period (P=0.03). GFR changes during the two treatment periods differed by 2 (25 to 14) ml/min per 1.73 m ² . The difference, however, was not significant (P=0.28).	
End point type	Primary
End point timeframe:	
Baseline compared to 1 month after Tolvaptan and Octreotide–Long-Acting Release and Tolvaptan and Placebo

Statistical analyses

Statistical analysis title	Primary comparisons endpoint
Statistical analysis description: The primary and secondary efficacy variables of this cross-over study were analyzed by paired t test (or Wilcoxon signed-rank test, in case of departure from normality assumptions) and, in a multivariable, exploratory approach, by using a linear mixed model for repeated measures (PROC MIXED, SAS version 9.2; SAS Institute Inc., Cary, NC), with sequence, period, and treatment as fixed effects and participant as random effect.	
Comparison groups	Tolvaptan-Placebo v Tolvaptan-Octreotide LAR
Number of subjects included in analysis	38
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.28 ^[1]
Method	unpaired t-test

Notes:

[1] - $H_0 : \text{diff} = 0$

where $\text{diff} = \text{delta1} - \text{delta2}$,

$\text{delta1} = \text{GFR 1 month octreotide} - \text{GFR baseline octreotide}$

$\text{delta2} = \text{GFR 1 month placebo} - \text{GFR baseline placebo}$.

Primary: Coprimary Comparisons GFR

End point title	Coprimary Comparisons GFR
End point description: During the first week treatment period, the GFR significantly decreased by 3 (0–7) ml/min per 1.73 m ² with tolvaptan and placebo therapy ($P=0.006$) and by 10 (26 to 16) ml/min per 1.73 m ² with dual therapy ($P,0.001$). Both changes significantly differed from the GFR changes were observed during the run-in period ($P=0.03$ and $P=0.001$, respectively). Notably, the GFR reduction achieved by tolvaptan and octreotide-LAR add-on therapy exceeded the reduction achieved by tolvaptan and placebo by 3 (0–12) ml/min per 1.73 m ² (Figure 1B), and the excess reduction was statistically significant ($P=0.01$).	
End point type	Primary
End point timeframe: Baseline compared to 1 week after Tolvaptan and Octreotide–Long-Acting Release and Tolvaptan and Placebo

Notes:

[2] - H0 : diff = 0

where diff = delta1-delta2,

delta1 = GFR 1 week octreotide - GFR baseline octreotide

delta2 = GFR 1 week placebo - GFR baseline placebo.

Secondary: Total Kidney Volume TKV

End point title	Total Kidney Volume TKV
-----------------	-------------------------

End point description:

TKV nonsignificantly decreased by 4 (-23 to 48) ml during the 1-month tolvaptan and placebo treatment period (P50.73), whereas it decreased significantly by 41 (25-77) ml during the 1-month treatment period with tolvaptan and octreotide-LAR (P <.001). TKV changes during the two treatment periods differed by 39.1613.3 ml, and the difference was statistically significant (P=0.01). Similar results were obtained by measuring height-adjusted TKV (data not shown). Changes in cystic kidney volume paralleled changes in TKV.
