Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 January 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	26 November 2019
Global end of trial reached?	Yes
Global end of trial date	26 November 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to assess the efficacy of cefepime-AAI101 compared to Piperacillin/Tazobactam in the treatment of cUTI, including acute pyelonephritis (AP).

Protection of trial subjects:

Patients were monitored for safety throughout the duration of the study. Safety assessments included vital signs, physical examinations, laboratory assessments, adverse event (AE) assessments, and electrocardiograms (ECGs). A triplicate 12-lead ECG was performed at Screening and Day 4. A pregnancy test was performed at Screening and TOC for female patients of childbearing potential. A Data Safety and Monitoring Board (DSMB) was established with the aim to safeguard the interests of the study participants, Investigators, and the Sponsor; to assess the safety of the study's interventions; to monitor the overall conduct of the study; and to protect its integrity and validity. The DSMB worked under an approved DSMB Charter.

Background therapy: -

Evidence for comparator:

Piperacillin/tazobactam has been the mainstay of empiric treatment of serious hospital infections; however, in many regions its efficacy has eroded due to local emergence or spread of new, more aggressive ESBLs and carbapenemases.

Actual start date of recruitment	28 September 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 4
Country: Number of subjects enrolled	Belarus: 70
Country: Number of subjects enrolled	Georgia: 66

Country: Number of subjects enrolled	United States: 1
Worldwide total number of subjects	1041
EEA total number of subjects	399

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	639
From 65 to 84 years	380
85 years and over	22

Subject disposition

Recruitment

Recruitment details:

Study Sites: 90 sites in Argentina, Belarus, Bulgaria, Croatia, Estonia, Georgia, Hungary, Latvia, Lithuania, Mexico, Peru, Poland, Russia, Serbia, Slovakia, South Africa, Spain, Ukraine, and the United States

Study Period: Approximately 61 weeks

Initiation Date: 24 September 2018

Completion Date: 26 November 2019

Pre-assignment

Screening details:

Adult patients ≥ 18 years of age with a clinical diagnosis of cUTI or AP requiring hospitalisation and at least 7 days of IV treatment were screened. Patients who received potentially effective systemic antibacterial therapy for a continuous duration of >24 hours during the previous 72 hours before the study-qualifying baseline urine were excluded.

Period 1

Period 1 title	Treatment period (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Monitor, Assessor, Subject

Blinding implementation details:

Randomization was coordinated through a centralized Interactive Response Technology system. To ensure balance among the treatment groups, randomization was stratified by: Type of infection, prior antibiotic therapy, and geographic region.

Arms

Are arms mutually exclusive?	Yes
Arm title	Cefepime-Enmetazobactam

Arm description:

2 g cefepime (FEP) plus 500 mg enmetazobactam (EMT) infused over a period of 2 hours once every 8 hours (q8h) for 7 days (up to 14 days in patients with a positive blood culture at baseline).

In patients with moderate renal impairment (estimated glomerular filtration rate [eGFR] <60 mL/min/1.73 m² and ≥ 30 mL/min/1.73 m²) the dose of FEP-EMT was adjusted to 1 g FEP plus 250 mg EMT, infused over a period of 2 hours q8h.

Arm type	Experimental
Investigational medicinal product name	Cefepime-Enmetazobactam
Investigational medicinal product code	FPE
Other name	Enmetazobactam = formerly AAI101
Pharmaceutical forms	Powder for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Study drug was prepared by an unblinded pharmacist (or qualified designee) according to the Pharmacy Manual. Cefepime-enmetazobactam was reconstituted in 20 mL normal saline (NS) and immediately mixed in the 250 mL saline bag for infusion. The i.v. bags were transferred to the blinded study staff for administration to the patient. At each administration of i.v. study drug, patients received a 270 mL infusion administered via a pump over a period of 2 hours.

In patients with moderate renal impairment (eGFR <60 mL/min/1.73 m² and ≥ 30 mL/min/1.73 m²) the dose of cefepime-enmetazobactam was adjusted to 1 g cefepime plus 250 mg enmetazobactam, infused over a period of 2 hours q8h.

Arm title	Piperacillin/Tazobactam
------------------	-------------------------

Arm description:

4.5 g piperacillin/tazobactam infused over a period of 2 hours q8h for 7 days (up to 14 days in patients with a positive blood culture at baseline). Dosing of piperacillin/tazobactam followed the

recommendations as per the respective summary of product characteristics, which did not require adjustment of the 4.5 g dose in patients with mild or moderate renal impairment.

Arm type	Active comparator
Investigational medicinal product name	Piperacillin / Tazobactam
Investigational medicinal product code	
Other name	PipTazo
Pharmaceutical forms	Powder for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Dosing of piperacillin/tazobactam followed the recommendations as per the respective summary of product characteristics, which did not require adjustment of the 4.5 g dose in patients with mild or moderate renal impairment.

Number of subjects in period 1	Cefepime- Enmetazobactam	Piperacillin/Tazobactam
Started	520	521
Completed	494	501
Not completed	26	20
Adverse event, serious fatal	-	3
Consent withdrawn by subject	7	6
Physician decision	-	1
Adverse event, non-fatal	3	2
Other	12	6
Lost to follow-up	3	2
Lack of efficacy	1	-

Primary: Overall Response at TOC - m-MITT Population

End point title	Overall Response at TOC - m-MITT Population
End point description: The primary efficacy parameter was the proportion of patients in the m-MITT Population (678 patients) who achieved overall treatment success at TOC. Overall treatment success was defined as the composite of clinical outcome of Cure and the microbiological outcome of Eradication (<10 ³ CFU/mL in urine culture). The majority of patients in the cefepime-enmetazobactam group (273 [79.1%] patients) had an overall response of success at TOC compared to the piperacillin/tazobactam group (196 [58.9%] patients), with a treatment difference of 21.2% (95% CI: 14.3, 27.9), demonstrating superiority of cefepime-enmetazobactam compared to piperacillin/tazobactam.	
End point type	Primary
End point timeframe: Table summarizes the primary efficacy analysis of overall response at Test-of-Cure (TOC) Visit for the m-MITT Population.

Statistical analyses

Statistical analysis title	Treatment Difference in Overall Success
-----------------------------------	---

Statistical analysis description:

The non-inferiority assessment was based on the stratified Newcombe 2-sided 95% confidence interval (CI) for the difference in the proportions of patients with overall treatment successes, calculated as the rate in the cefepime-AAI101 group minus that of the piperacillin/tazobactam group. The non-inferiority margin was a difference of 10 percentage points. Non-inferiority was concluded if the lower limit of the 2-sided 95% CI was >-10 .

Statistical analysis title	Treatment Difference in Overall Success Sup
-----------------------------------	---

Statistical analysis description:

If non-inferiority was demonstrated, an assessment for superiority on the primary endpoint was performed as a secondary objective without the need for type I error alpha correction. Superiority was shown if the treatment difference was positive and the lower bound of the 95% CI around this difference was greater than zero.

Secondary: ESBL Subgroup Analysis at Test of Cure - m-MITT Population

End point title	ESBL Subgroup Analysis at Test of Cure - m-MITT Population
-----------------	--

End point description:

Descriptive statistics are provided here.

For overall response of success* at TOC Visit, the subgroups of patients with ESBL co-producing (ESBL-genotype, combined with or without any other non-ESBL genotype), ESBL-only producing, ESBL co-producing (CTX-M-type), and ESBL-only producing (CTX-M-type) at baseline had a treatment difference that demonstrated superiority of cefepime-AAI101 compared to piperacillin/tazobactam.

The following sub-groups were not evaluable due to low numbers: ESBL co-producing (non-CTX-M-type), ESBL-only producing (non-CTX-M-type), AmpC co-producing, AmpC-only producing.

Results of the subgroup analysis of overall response for all ESBL-producing isolates of enterobacteriaceae subgroups at TOC Visit (m-MITT Population) is provided in the attached table, together with a Forest Plot illustrating overall success at TOC Visit by various subgroups.

*Overall Success was defined as clinical cure or improvement and microbiological eradication.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse events for the Safety Population are documented from the time of first study drug administration until completion of study participation.

Adverse event reporting additional description:

The safety and tolerability profile was determined by incidence and severity of Adverse Events and Serious Adverse Events, vital signs, laboratory tests, ECGs, and physical examinations from Screening through Late Follow-Up (End of Treatment + 14 days [± 2 days]).

Threshold for non-serious adverse event reporting is: 2%

Assessment type	Systematic

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
05 April 2018	<p>Amendment no.1: Piperacillin/tazobactam was selected to be used as a comparator in this complicated urinary tract infection (cUTI) trial due to its antibacterial spectrum, its pharmacokinetic properties and due to the fact that it is a beta-lactam/beta-lactamase inhibitor combination very similar to the cefepime/AAI101 combination.</p> <p>Inclusion Criterion 3 was revised to define permanent sterilization for women who are no longer of childbearing potential. A new Exclusion Criterion 1 was added to exclude patients who have qualifying Gram-positive primary pathogen at $\geq 10^5$ colony-forming units (CFU)/mL. Exclusion Criterion 2 was revised to reflect piperacillin/tazobactam as the comparator drug. Exclusion Criterion 7 was revised to define the exceptions to the receipt of potentially effective systemic antibacterial therapy for continuous duration of >24 hours during the previous 72 hours before study-qualifying baseline urine is collected. Exclusion Criterion 10 was adjusted to match the extended duration of treatment. Exclusion Criterion 15 was revised to note glomerular filtration rate rather than creatinine clearance. Exclusion Criterion 25 was revised to further define the time prior to Screening regarding the administration of experimental medication.</p> <p>Piperacillin/tazobactam will be administered over a period of 2 hours once every 8 hours (q8h) for 7 days. Possible treatment duration was extended from 7 to 10 days to 7 to 14 days in patients with a positive blood culture at baseline. The criteria for microbiological outcome were revised.</p> <p>Prothrombin and partial thromboplastin time were added to clinical laboratory assessments.</p> <p>The number of sites was reduced from 120 to 115.</p> <p>The schedule of procedures and clinical laboratory analytes was updated to reflect the changes specified herein, where applicable. Other minor edits were made throughout the document to improve clarity, consistency, and to correct grammatical errors.</p>
19 June 2018	<p>Amendment no.2: This amendment was developed in response to Food and Drug Administration (FDA) feedback during the end of Phase 2 meeting and a review of the amended protocol. Other minor edits were made throughout the document to correct grammatical errors and inconsistencies.</p> <p>The study population was updated to specify that at least 50% of patients will have complicated urinary tract infection (cUTI) and at least 30% will have acute pyelonephritis (AP).</p> <p>Exclusion Criterion 15 was revised to specify that patients with impairment of renal function with estimated glomerular filtration rate (eGFR) <30 mL/min/1.73 m² are excluded from the study. In Exclusion Criterion 22, it was specified that patients with current clinically significant liver disease, including any form of known liver cirrhosis are also excluded from the study.</p> <p>Dosing in patients with renal insufficiency was updated to be consistent with Exclusion Criterion 15.</p> <p>It was specified that a triplicate 12-lead electrocardiogram (ECG) will be performed at Screening and Day 4.</p> <p>It was clarified that up to 2 Gram-negative bacterial isolates per urine culture (at concentrations of $\geq 10^5$ CFU/mL of urine) will be considered as qualifying pathogens.</p> <p>The overall response to a clinical outcome of Cure and microbiological outcome of Indeterminate was updated to Indeterminate.</p> <p>Secondary efficacy parameters were updated to include additional subsets of patients.</p> <p>Protocol Section was added to clarify adverse events of special interest.</p> <p>Sample size determination was revised.</p> <p>Direct bilirubin and C-reactive protein were added to the clinical laboratory analysis.</p> <p>The relevant protocol tables and schedule of procedures were updated to reflect the changes specified herein, where applicable.</p>

02 August 2018	<p>Amendment no.3: This amendment was developed in response to Food and Drug Administration feedback during the end of Phase 2 meeting and a review of the amended protocol. Other minor edits were made throughout the document to correct grammatical errors and inconsistencies.</p> <p>Inclusion Criterion 7 was updated to clarify that if the patient has met the criteria for complicated urinary tract infection (cUTI) and acute pyelonephritis (AP), the infection type would be considered cUTI for randomization and analysis purposes. Collection of blood samples for PK analysis was clarified for Day 7 and the Early Termination visit.</p> <p>A Study Scheme figure was added.</p> <p>Dosing in patients with renal insufficiency was updated to clarify confirmation for patients with normal renal function or mild or moderate renal impairment at baseline.</p> <p>Collection of laboratory assessments was updated to clarify collections on Day 7; Days 8, 9, 11, 12, or 13; and Day 10.</p> <p>Adverse events of special interest were updated for the new laboratory assessment collected on Day 10.</p> <p>Criteria for study drug discontinuation were updated.</p> <p>Expedited reporting was clarified.</p> <p>The relevant protocol tables and schedule of procedures were updated to reflect the changes specified herein, where applicable.</p>
06 September 2018	<p>Amendment no.4: This amendment was developed in response to Food and Drug Administration feedback during the End of Phase 2 meeting and a review of the amended protocol. Other minor edits were made throughout the document to correct grammatical errors and inconsistencies.</p> <p>Study design was updated to include that the Test of Cure (TOC) visit will occur 7 days after End of Treatment (EOT) (EOT + 7 days [± 2 days]) for patients receiving 7 days of treatment and 19 days after randomization (randomization + 19 days [± 2 days]) for patients receiving more than 7 days of treatment. The Late Follow-up (LFU) visit was also updated to clarify that the LFU visit should not take place earlier than 3 days after the TOC visit.</p> <p>It was specified that for patients without bacteremia, treatment cannot be prolonged for more than 7 days.</p> <p>The blood samples collection time for laboratory assessments on Day 1 was clarified.</p> <p>It was clarified that in patients with moderate renal impairment, dose adjustment is applicable from Day 1 of dosing.</p> <p>Direct bilirubin was removed from the screening laboratory assessments for eligibility.</p> <p>The relevant protocol tables and schedule of procedures were updated to reflect the changes specified herein, where applicable.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
