

Clinical trial results:

A phase 3, multicenter, double-blind, placebo-controlled, randomized, outpatient two-period two-treatment crossover study to evaluate the efficacy and safety of amifampridine phosphate (3,4 diaminopyridine phosphate) in patients with Congenital Myasthenic Syndromes (CMS)

Summary

EudraCT number	2018-000358-23
Trial protocol	IT
Global end of trial date	24 January 2019

Results information

Result version number	v1 (current)

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 January 2021
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	24 January 2019
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

- To characterize the overall safety and tolerability of amifampridine phosphate compared with placebo in patients with CMS;
- To assess the clinical efficacy of amifampridine phosphate compared with placebo in patients with CMS, based on improvement in subject global impression (SGI) and motor function measure (MFM 20 or 32) scores

Protection of trial subjects:

The investigator could prescribe additional medications during the study, as long as the prescribed medication was not prohibited by the protocol. In the event of an emergency, any needed medications could be prescribed without prior approval, but it was required that the Medical Monitor be notified of the use of any contraindicated medications immediately thereafter.

Background therapy:

None

Evidence for comparator:

The diagnosis and management of children with congenital myasthenic syndromes (CMS) are challenging and the response to treatment in CMS depends on the type of defect (pre-synaptic, synaptic, post-synaptic) and the kinetics of the channel affected (fast versus slow). Most patients are eligible and respond to pharmacologic intervention, including acetylcholinesterase inhibitors, 3,4-diaminopyridine (3,4-DAP), ephedrine, fluoxetine or quinidine, and albuterol. The particular therapy is dictated by the diagnosed CMS subtype, as drugs beneficial in one subtype can be detrimental in another subtype.

Actual start date of recruitment	30 January 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Canada: 2

In utero	0
----------	---

Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	9
Adolescents (12-17 years)	3
Adults (18-64 years)	3
From 65 to 84 years	1
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

From 08 February 2016 to 24 January 2019, at 6 sites in the US and one site in Canada, patients were recruited and, after screening, were randomized on the last day of the open-label run-in period (Day 0) to either Treatment Sequence 1 or 2, in a 1:1 ratio.

Pre-assignment

Screening details:

Patients who completed screening proceeded to the run-in period. Patients who were previously naïve to amifampridine or amifampridine phosphate treatment began up-titration of medication, with frequent clinic evaluation for up to 4 weeks, until reaching a stable dose and frequency for 7 days. The patient must improve by 20% on MFM20 or 32.

Pre-assignment period milestones

Number of subjects started	27 ^[1]
Number of subjects completed	16

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Screening failure: 11
----------------------------	-----------------------

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Some patients who had started the pre-assignment period were screen failures and were not enrolled in the trial.

Period 1

Period 1 title	Period 1 Days 1-8
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer

Blinding implementation details:

The placebo was provided as tablets indistinguishable from amifampridine phosphate.

Arms

Are arms mutually exclusive?	Yes
Arm title	Amifampridine phosphate

Arm description: -

Arm type	Experimental
Investigational medicinal product name	Amifampridine phosphate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

The amifampridine phosphate total daily dose of 10 mg to 80 mg, given in 2 to 4 divided doses, with no single dose >15 mg in patients up to 16 years of age or >20 mg in patients >16 years of age was chosen based on completed animal and in vitro pharmacology, pharmacokinetic, and toxicology studies. The dose of amifampridine phosphate was individually determined by the investigator, within the bounds of a total daily dose of 10 mg to 80 mg, divided into doses taken 2 to 4 times per day. Doses of amifampridine phosphate were taken with food (e.g., breakfast, lunch, dinner, and snack before bed) as prescribed by the investigator, based on optimal neuromuscular benefit.

Arm title	Placebo
------------------	---------

Arm description: -	
Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

A placebo equivalent was provided as tablets indistinguishable from the amifampridine phosphate tablets. The placebo was administered consistent with the dosing regimen of amifampridine phosphate. The dose of amifampridine phosphate was individually determined by the investigator, within the bounds of a total daily dose of 10 mg to 80 mg, divided into doses taken 2 to 4 times per day. Doses of amifampridine phosphate were taken with food (e.g., breakfast, lunch, dinner, and snack before bed) as prescribed by the investigator, based on optimal neuromuscular benefit.

SGI Score Day 0			
The SGI was a 7-point scale on which the patient rated their global impression of the effects of a study treatment (1=terrible to 7=delightful). The SGI was assessed by the patient or the patient's parent/guardian/caregiver if the patient was unable to complete the SGI. The SGI had demonstrated concordance with the physician's assessment of improvement.			
Units: Score			
arithmetic mean	5.11	5.75

SGI Score Day 21			
The SGI was a 7-point scale on which the patient rated their global impression of the effects of a study treatment (1=terrible to 7=delightful). The SGI was assessed by the patient or the patient's parent/guardian/caregiver if the patient was unable to complete the SGI. The SGI had demonstrated concordance with the physician's assessment of improvement			
Units: Score			
arithmetic mean	5.88	6.14	
standard deviation	± 0.64	± 1.21	-
Slurp test Day 0			
The slurp test was optional. Subjects were instructed to drink four ounces of water through a standard flex straw as quickly as possible, making a loud slurping sound at the end. The duration of time from the start of drinking the water to the slurp sound was recorded. On Day 0 this test was performed by 2 subjects in the group of amifampridine and 3 subjects in the placebo group.			
Units: second			
arithmetic mean	12.95	7.73	
standard deviation	± 5.59	± 2.88	-
Slurp test Day 21			
The slurp test was optional. Subjects were instructed to drink four ounces of water through a standard flex straw as quickly as possible, making a loud slurping sound at the end. The duration of time from the start of drinking the water to the slurp sound was recorded. On Day 21 this test was performed by 6 subjects in the group of amifampridine and 4 subjects in the placebo group.			
Units: second			
arithmetic mean	13.64	8.33	
standard deviation	± 10.73	± 1.83	-

Statistical analyses

Statistical analysis title	Change from baseline at the end of period 1
Comparison groups	Amifampridine phosphate v Placebo
Number of subjects included in analysis	16
Analysis specification	Pre-specified
Analysis type	equivalence
P-value	= 0.085 ^[1]
Method	Wilcoxon (Mann-Whitney)

Notes:

[1] - A Mann-Whitney-Wilcoxon test demonstrated that the difference in mean CFB in SGI score at the end of Study Period 1 was not statistically significant (p=0.085) between the two sequences.

Statistical analysis title	Change from baseline crossover
Comparison groups	Amifampridine phosphate v Placebo v Amifampridine phosphate v Placebo

Number of subjects included in analysis	31
Analysis specification	Pre-specified
Analysis type	equivalence ^[2]
P-value	= 0.441
Method	Wilcoxon (Mann-Whitney)

Notes:

[2] - The difference between the Period 1 CFB and Period 2 CFB was analyzed in the Mann-Whitney-Wilcoxon test. The results demonstrate that while subjects may have experienced an improvement in raw SGI scores while taking amifampridine phosphate versus placebo the treatment effect was not statistically significant.

Secondary: Change from baseline MFM-20 score

End point title	Change from baseline MFM-20 score
-----------------	-----------------------------------

End point description:

D-1, Standing Position and Transfers; D-2, Axial and Proximal Limb Motor Function; and D-3, Distal Motor Function.

The MFM was not the best scale for measuring symptoms and individual patient deficits. Particularly, in patients who had oculo-bulbar deficits (e.g., difficulty swallowing and respiratory deficits) the MFM is focused on motor movements and, as such, these patients may not have demonstrated improvement on the MFM scale. Nevertheless, the MFM was the only validated scale to include children as young as 2 years old and was therefore chosen for measurement of the secondary efficacy endpoint in this first placebo-controlled trial of genetically confirmed CMS patients.

End point type	Secondary

occurrences (all)	2		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 February 2016	Administrative change to clarify the original intent of a reasonable time (at least three months) between the last SGI and MFM 20 or MFM 30 assessments and the first incidence of these assessments in the protocol. This was done to provide clarity on duration between testing to avoid testing bias.
07 March 2016	An administrative change to correct the use of the term "sequence" from "period" and "outpatient" versus "office visit". This was done to provide clarity.
25 April 2017	This amendment increased the age range of eligible subjects, expanded the statistical analysis section of the protocol increased the number of patients in the study from 10 to 23 and updated previous instruction language regarding dosing on the days of clinic evaluations.
26 June 2017	Amendments 4 and 5 formally removed videotaping of patients from the protocol, clarified start and stop times of Periods 1 and 2, blinded medication dosing, and removed the Day 36 visit. The patient was either on a stable dose of amifampridine phosphate or had been titrated over a period of 4 weeks. Additionally, the patient was observed on open-label medication for 2 weeks during the restabilization period. Therefore, the Day 36 visit on open-label medication provided no new information to the efficacy or safety profile of amifampridine phosphate and the patient could then go directly into the expanded access program.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

None

Notes:
