

Clinical trial results:

A Study of the Pharmacokinetics of Melphalan During Treatment with Melflufen and Dexamethasone in Patients with Relapsed Refractory Multiple Myeloma and Impaired Renal Function

Summary

EudraCT number	2018-000478-31
Trial protocol	CZ PL GR
Global end of trial date	22 December 2021

Results information

Result version number	v1 (current)
This version publication date	11 October 2022
First version publication date	11 October 2022

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	22 December 2021
Is this the analysis of the primary completion data?	Yes
Primary completion date	22 December 2021
Global end of trial reached?	Yes
Global end of trial date	22 December 2021
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

- To evaluate the relationship between renal function and the pharmacokinetic parameters for melphalan during treatment with melflufen
- To assess the safety and tolerability of melflufen in patients with moderate (Cohorts 1a and 1b) and severe (Cohorts 2a and 2b) renal impairment

Note: Cohort 2b was not enrolled as the study was terminated early.

Protection of trial subjects:

This clinical study was designed, implemented, and reported in accordance with the ICH Harmonised Tripartite Guidelines for GCP, with applicable local regulations (including European Directive 2001/20/EC and US Code of Federal Regulations Title 21), and with the ethical principles laid down in the Declaration of Helsinki. Eligible patients were only to be included in the study after providing written (witnessed, where required by law or regulation), IEC-approved informed consent. The clinical study was designed based on well-established guidance for oncology studies including RRMM management, response assessment, and National Comprehensive Cancer Network Guidelines.

Background therapy:

Dexamethasone 40 mg administered orally on Days 1, 8, 15, and 22 of each 28-day cycle for patients aged <75 years

OR

Dexamethasone 20 mg administered orally on Days 1, 8, 15, and 22 of each 28-day cycle for patients aged ≥75 years

Evidence for comparator:

Not applicable

Actual start date of recruitment	28 August 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 10
Country: Number of subjects enrolled	Czechia: 9
Country: Number of subjects enrolled	Greece: 16
Worldwide total number of subjects	35
EEA total number of subjects	35

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	10
From 65 to 84 years	24
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

The first patient (in Cohort 1a) received their first dose of study drug on 17 September 2018. The last patient (in Cohort 2a) received their first dose of study drug on 29 June 2021.

Pre-assignment

Screening details:

Key inclusion criteria: age 18 or older; prior diagnosis of multiple myeloma; received at least 2 prior lines of therapy; measurable disease; life expectancy of at least 6 months; estimated glomerular filtration rate between ≥ 30 to < 45 mL/min/1.73m² (Cohort 1) or between ≥ 15 to < 30 mL/min/1.73m² (Cohort 2).

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

Not applicable

Arms

Are arms mutually exclusive?	Yes
Arm title	Cohort 1a

Arm description:

Patients with moderate renal impairment (eGFR ≥ 30 to < 45 mL/min/1.73m²) and a starting dose of melflufen of 40 mg

Arm type	Experimental
Investigational medicinal product name	Melflufen
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for injection/infusion
Routes of administration	Infusion

Dosage and administration details:

Melflufen at a starting dose of 40 mg administered as a 30-minute intravenous infusion on Day 1 of every 28-day cycle via a central catheter. Melflufen was distributed in the EU as a powder for concentrate for solution for infusion; in the US, it was distributed as a powder for injection.

Arm title	Cohort 1b
------------------	-----------

Arm description:

Patients with moderate renal impairment (eGFR ≥ 30 to < 45 mL/min/1.73m²) and a starting dose of melflufen of 30 mg

Arm type	Experimental
Investigational medicinal product name	Melflufen
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for injection/infusion
Routes of administration	Infusion

Dosage and administration details:

Melflufen at a starting dose of 30 mg administered as a 30-minute intravenous infusion on Day 1 of every 28-day cycle via a central catheter. Melflufen was distributed in the EU as a powder for concentrate for solution for infusion; in the US, it was distributed as a powder for injection.

Arm title	Cohort 2a
------------------	-----------

Arm description:

Patients with severe renal impairment (eGFR of ≥ 15 to < 30 mL/min/1.73m²) and a starting dose of melflufen of 20 mg

Arm type	Experimental
Investigational medicinal product name	Melflufen
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for injection/infusion
Routes of administration	Infusion

Dosage and administration details:

Melflufen at a starting dose of 20 mg administered as a 30-minute intravenous infusion on Day 1 of every 28-day cycle via a central catheter. Melflufen was distributed in the EU as a powder for concentrate for solution for infusion; in the US, it was distributed as a powder for injection.

Number of subjects in period 1	Cohort 1a	Cohort 1b	Cohort 2a
Started	21	10	4
Completed	0	0	0
Not completed	21	10	4
Physician decision	3	1	-
Disease progression	8	5	3
Adverse event	7	1	-
Study terminated by sponsor	2	1	1
Patient request to stop treatment	1	2	-

Relapsed-refractory	8	7	2
Prior autologous transplants Units: Subjects			
At least 1 prior autologous transplant	9	1	1
No prior autologous transplant	12	9	3
Number of prior systemic therapy lines			
There was one patient who reported 2 prior line of therapies but only one of them was multiple myeloma therapy. However, this exception was not reflected in the database since a minimum of 2 lines were possible to report. Although this patient was enrolled into the study incorrectly, the patient was not excluded from analyses.			
Units: Subjects			
2 prior lines of therapy	5	6	2
3 prior lines of therapy	7	2	1
4 prior lines of therapy	9	2	1
Baseline estimated glomerular filtration rate (eGFR)			
Note that eligibility was based on eGFR measured at Screening, while Baseline measurements are from Cycle 1 Day 1. For some patients, the eGFR value was derived using CKD-EPI formula when eGFR was not reported but the corresponding visit serum creatinine value was available.			
Units: Subjects			
≥15 to <30 mL/min/1.73m ²	0	2	4
≥30 to <45 mL/min/1.73m ²	19	8	0
≥45 mL/min/1.73m ²	2	0	0
Cytogenetics abnormalities identified by iFISH at study entry			
High-risk based on interphase fluorescence in situ hybridization (iFISH) is defined in case the following abnormalities were found: deletion (17p), gain 1q (+1q), gain (1q21); t (4;14), t(4;14) (p16;q32), t (14;16), t (14;16) (q32;q23), t(14;20), t(14;20) (q32;q11). Standard-risk based on iFISH consists of patients who have a genetic subtype recorded but none of the genetic subtypes categorized as high-risk based on iFISH. The category of unknown consists of patients for whom the iFISH procedure was not done or unevaluable.			
Units: Subjects

Primary: Elimination half-life of melphalan

End point title	Elimination half-life of melphalan ^[21]
-----------------	--

End point description:

End point type	Primary
----------------	---------

End point timeframe:

Samples were collected 5-10 minutes after the end of infusion, 2-3 hours after the end of infusion, and 5-7 hours after the end of infusion.

Notes:

[21] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Only results based on non-compartmental method are available. An updated population PK analysis, including subjects from this study together with PK data from other studies with melphalan, will be reported separately in a population PK report.

End point values	Cohort 1a	Cohort 1b	Cohort 2a	Safety Analysis Set
Subject group type	Reporting group	Reporting group	Reporting group	Subject analysis set
Number of subjects analysed	13 ^[22]	6 ^[23]	4 ^[24]	22 ^[25]
Units: minutes				
arithmetic mean (standard deviation)				
Cycle 1	89.1390 (± 15.575)	98.3568 (± 27.249)	109.5502 (± 22.221)	94.9451 (± 20.368)
Cycle 2	87.5544 (± 15.860)	90.7844 (± 14.411)	136.2193 (± 13.679)	96.7419 (± 23.102)

Notes:

[22] - 13 subjects in Cycle 1; 9 subjects in Cycle 2

[23] - 5 subjects in Cycle 1; 6 subjects in Cycle 2

[24] - 4 subjects in Cycle 1; 3 subjects in Cycle 2

[25] - 22 subjects in Cycle 1; 18 subjects in Cycle 2

Statistical analyses

No statistical analyses for this end point

Secondary: Overall response rate

End point title	Overall response rate
-----------------	-----------------------

End point description:

Overall response rate (ORR) is the proportion of patients who achieved a confirmed response of stringent complete response (sCR), complete response (CR), very good partial response (VGPR), or partial response (PR) as best response, as assessed by the Investigator.

End point type	Secondary
----------------	-----------

End point timeframe:

Patients were assessed for response after each cycle. After discontinuation of therapy, patients continued to be assessed until documented progression (confirmed on 2 consecutive assessments) or initiation of subsequent therapy.

Secondary: Progression-Free Survival

End point title	Progression-Free Survival
-----------------	---------------------------

End point description:

Progression-free survival (PFS) is defined as the time in months from initiation of therapy to the earlier of confirmed disease progression or death due to any cause. Patients were deemed 'progressed' in case of i) unconfirmed progressive disease (PD) as the final response assessment, ii) death after at least one response assessment or PD based on at least two consecutive response assessments at any time, or iii) death before the first response assessment. The distribution of PFS was summarized using the Kaplan-Meier (K-M) method. The median PFS was estimated from the 50th percentile of the corresponding K-M estimates. The 95% confidence interval for median PFS was constructed using the method of Brookmeyer (Brookmeyer, 1982).

(99999 = not estimable)

End point type	Secondary
----------------	-----------

End point timeframe:

Patients were assessed from the first dose of study drug until confirmed disease progression, initiation of subsequent therapy or death, whichever comes first.

End point values	Cohort 1a	Cohort 1b	Cohort 2a	Safety Analysis Set
Subject group type	Reporting group	Reporting group	Reporting group	Subject analysis set
Number of subjects analysed	15	6	3	24
Units: months				
median (confidence interval 95%)	8.61 (4.30 to 14.52)	7.66 (6.24 to 99999)	3.43 (0.95 to 99999)	7.66 (4.73 to 14.52)

Statistical analyses

Secondary: Duration of response

End point title	Duration of response
-----------------	----------------------

End point description:

Duration of response (DOR) is defined as the time from the first evidence of confirmed assessment of stringent complete response (sCR), complete response (CR), very good partial response (VGPR), or partial response (PR) to first confirmed disease progression, or to death due to any cause. The distribution of DOR was summarized using the Kaplan-Meier (K-M) method. The median DOR was estimated from the 50th percentile of the corresponding K-M estimates. The 95% confidence interval for median DOR was constructed using the method of Brookmeyer (Brookmeyer, 1982).

(99999 = not estimable)

End point type	Secondary
----------------	-----------

End point timeframe:

Patients were assessed for response from the first measure of a confirmed response (PR or better) until confirmed progression, death, or initiation of subsequent therapy.

End point values	Cohort 1a	Cohort 1b	Cohort 2a	Safety Analysis Set

Secondary: Duration of clinical benefit

End point title	Duration of clinical benefit
End point description: Duration of clinical benefit (DOCB) was calculated as time in months from the first evidence of confirmed assessment of stringent complete response (sCR), complete response (CR), very good partial response (VGPR), partial response (PR), or minimal response (MR) to first confirmed disease progression, or to death due to any cause. DOCB was defined only for patients with a confirmed MR or better. DOCB was summarized using the Kaplan-Meier (K-M) method. The median DOCB was estimated from the 50th percentile of the corresponding K-M estimates. The 95% confidence interval for median DOCB was constructed using the method of Brookmeyer (Brookmeyer, 1982).

median (confidence interval 95%)	9.76 (5.06 to 15.38)	99999 (6.83 to 99999)	99999 (3.15 to 99999)	10.18 (6.31 to 99999)

Statistical analyses

No statistical analyses for this end point

Secondary: Best confirmed response

End point title	Best confirmed response
-----------------	-------------------------

End point description:

Best confirmed response required 2 consecutive assessments with the same response result made at any time. In case at the second consecutive assessment (made at any time) the response is higher than the previous one, then confirmed response (linked to the first assessment visit) will be the first one (e.g., PR – VGPR consecutive pair will lead to a PR confirmed response at the first visit). In case the second consecutive response is lower than the first one, then confirmed response (linked to the first assessment visit) will be the second one (e.g. CR-VGPR consecutive pair will lead to a VGPR confirmed response at the first visit).

End point type	Secondary
----------------	-----------

End point timeframe:

Patients were assessed for response after each cycle. After discontinuation of therapy, patients continued to be assessed until documented progression (confirmed on 2 consecutive assessments) or initiation of subsequent therapy.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Non-serious adverse events (AEs) were reported from the first dose of study drug until 30 days after the last dose of study drug, or until the start of subsequent anticancer therapy (whichever occurred first).

Adverse event reporting additional description:

Serious adverse events (SAEs) were to be reported from when the patient signed informed consent until 30 days after the last administration of any study drug. SAEs considered by the investigator to be treatment-related were reported also if they occurred later than 30 days after the last administration of any study drug.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
19 November 2018	<ul style="list-style-type: none">* Addition of a potential Cohort 2 of at least 6 patients with severe renal impairment to further evaluate melflufen in this patient population* Change of the patient population to 2 - 4 prior lines of therapy* Change of the method of estimation of creatinine clearance (CrCl)* Addition of an alternate method of drug preparation of melflufen, to allow for dilution with saline to increase the time from drug reconstitution to start of infusion
26 September 2019	<ul style="list-style-type: none">* The study will be divided into three cohorts; 1a, 1b and 2. To evaluate 30 mg of melflufen as starting dose in Cohort 1 (eGFR of ≥ 30 mL/min to < 45 mL/min). There will be two groups of patients in Cohort 1; 1a that received 40 mg of melflufen as starting dose, and 1b that will receive 30 mg as starting dose. Cohort 1a will close for enrolment following approval of amendment 2.* The starting dose for Cohort 2 will be decided following evaluation of data from Cohort 1a and 1b and after recommendations by DSMC.
26 March 2020	<ul style="list-style-type: none">* Reduced the number of patient visits to mitigate COVID-19-related patient risks.* Updated planned number of the subjects to be included. The rationale of this increase was a target of 25 PK-evaluable patients, and therefore 35-40 patients in total needed to be enrolled as not all patients are PK evaluable.
22 January 2021	<ul style="list-style-type: none">* An interim analysis for an interim clinical study report (iCSR), to conclude the results from Cohort 1, has been included in the protocol.* Cohort 2 will consist of two groups (2a and 2b) and as more cohorts are added, the number of PK-evaluable patients have increased from 25 to approximately 35.* The DSMC-confirmed starting dose for Cohort 2a of 20 mg melflufen has been added, including dose reductions steps for this cohort. Furthermore Cohort 2b will only open if recommended by DSMC after evaluating data from Cohort 1a, 1b and Cohort 2a.
30 April 2021	The protocol has been updated with changes to inclusion criteria 3 and 10. The upper limits of allowed prior lines have been removed and a wider eGFR window allowed for patients to proceed from Screening 1 to Screening 2 has been updated in this version of the protocol.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
08 July 2021	The head-to-head phase 3 OCEAN study evaluated the efficacy and safety of melflufen plus dexamethasone versus pomalidomide plus dexamethasone in patients with relapsed refractory multiple myeloma who have received 2 – 4 prior lines of therapy. Based on the observed large differences in overall survival in pre-specified subgroups in the OCEAN study, the US Food and Drug Administration requested a partial clinical hold of all clinical studies with melflufen.	-

Notes:

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Between-group comparisons were not performed in this study due the small number of patients in each cohort, as well as differences with regards to some baseline characteristics.

Notes:
