Primary: Complete response (CR) rate at the time of primary response assessment (PRA) based on positron emission tomography - computed tomography (PET-CT) as determined by independent review committee (IRC)

End point title	Complete response (CR) rate at the time of primary response assessment (PRA) based on positron emission tomography - computed tomography (PET-CT) as determined by independent review committee (IRC) ^[1]
End point description: The CR rate was defined as the percentage of participants with CR. Assessments were made according to the Lugano 2014 Response Criteria. The intent-to-treat (ITT) population consisted of all participants. Efficacy analyses for Arms A1, A2, and B were exploratory. The primary efficacy analysis compared Arm 1 vs Arm 2, with participants grouped according to the treatment arm assigned at randomization. Group C was included in secondary efficacy analysis, and efficacy analyses for Arms A1, A2, and B were exploratory.	
End point type	Primary
End point timeframe: 6-8 weeks after either C6D1 or last dose of study treatment	

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: Efficacy analyses for Arms A1, A2, and B were exploratory. The primary efficacy analysis compared Arm 1 vs Arm 2, with participants grouped according to the treatment arm assigned at randomization. Group C was included in secondary efficacy analysis.

Secondary: Baseline prevalence and incidence of treatment emergent anti-drug antibodies (ADA) to Mosunetuzumab

End point title	Baseline prevalence and incidence of treatment emergent anti-drug antibodies (ADA) to Mosunetuzumab ^[33]
-----------------	---

End point description:

Participants are considered to have treatment-induced ADA responses if they are ADA negative or missing data at baseline and then develop an ADA response following study drug administration. Participants are considered to have treatment-enhanced ADA responses if they are ADA positive at baseline and the titer of one or more post baseline samples is at least 4-fold greater than the titer of the baseline sample. Patients are considered to be negative for ADAs if they are ADA negative at all timepoints or if they are ADA positive at baseline but do not have any post-baseline samples with a titer that is at least 4-fold greater than the titer of the baseline sample (treatment unaffected). The immunogenicity analysis population included all participants with at least one ADA assessment. The number of participants analyzed are the values for baseline-evaluable participants and post-baseline evaluable participants.

Justification: This endpoint was specific to arms assigned to treatment with mosunetuzumab.
