Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	28 January 2025
Is this the analysis of the primary completion data?	Yes
Primary completion date	10 December 2023
Global end of trial reached?	Yes
Global end of trial date	14 December 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective was to determine whether intravenous sedation with the α_2 -agonist agents, dexmedetomidine or clonidine, can decrease the time to successful extubation from MV among adult critically ill patients.

Protection of trial subjects:

This was a trial of ICU sedation. All patients were incapacitated when eligible for inclusion. The ethical framework used protected participants through the Clinical Trials Directive guidance about including patients lacking mental capacity. Consent was provided by Professional Legal Representative or Personal Legal Representative according to a process agreed with the ethics committee. Deferred consent was also permitted according to agreed circumstances.

All patients were monitored for sedation state and comfort using validated tools. Clinicians adjusted therapy to achieve the desired level of sedation and analgesia. Any pain or distress was managed by clinical teams using clinical judgement and best practice.

Background therapy:

All patients received the following according to individual need and clinical judgement:

- Mechanical ventilation
- Other forms of organ support to treat critical illness
- Any other treatments indicated for critical illness, such as antibiotics for infection
- All other treatments and therapies considered standard of care for ICU patients

Evidence for comparator:

The comparator or usual care treatment was propofol-based sedation. This is the most widely used sedative in critical care practice, and is recommended as first line sedative in clinical guidelines.

Actual start date of recruitment	11 December 2018
Long term follow-up planned	Yes
Long term follow-up rationale	Scientific research
Long term follow-up duration	6 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects**Subjects enrolled per country**

Country: Number of subjects enrolled	United Kingdom: 1404
--------------------------------------	----------------------

Worldwide total number of subjects	1404
EEA total number of subjects	0

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	827
From 65 to 84 years	561
85 years and over	16

Subject disposition

Recruitment

Recruitment details:

Start of recruitment: 11 Dec 2018

End of recruitment: 27 Oct 2023

Recruited from ICU units at 38 UK sites:

4 sites in Scotland

2 sites in Wales

2 sites in Ireland

30 sites in England

Pre-assignment

Screening details:

Screening started as early as possible post-ICU admission, ideally within 6 hours. Screening continued for up to 48 hours following the start of Mechanical Ventilation (MV) in the ICU.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

This was an open-label trial. Clinicians were not blinded from group allocation or from the treatment during its administration.

Collection of the primary outcome and hospital-based secondary outcomes was not concealed or blinded from local research staff

Collection of long term telephone based secondary outcomes was concealed from research staff

Arms

Are arms mutually exclusive?	Yes
Arm title	Dexmedetomidine

Arm description:

Participants commenced intravenous infusion of open-label dexmedetomidine according to a weight-based dose regimen as early as possible post randomisation, and within a maximum of two hours. Bedside clinical staff transitioned patients to achieve sedation with dexmedetomidine as quickly as clinically feasible and safe, to replicate the way these drugs were used in routine practice. Additional opiate was used for analgesia using clinical judgement. Once dexmedetomidine was established, additional propofol was only used when the maximum $\alpha 2$ -agonist dose was reached or because cardiovascular or other side-effects limited dose escalation. The regimen followed the manufacturer's guidance and regimens used in previous trials. No loading dose was administered. The starting dose was 0.7 μ g/kg/hour titrated to a maximum dose 1.4 μ g/kg/hour.

Arm type	Experimental
Investigational medicinal product name	Dexmedetomidine - Dexdor 100 micrograms/ml concentrate for solution for infusion
Investigational medicinal product code	PLGB 27925/0104
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

For dexmedetomidine, the regimen will follow the manufacturer's guidance and regimens used in previous trials. No loading dose will be administered. The starting dose will be 0.7 μ g.kg-1.hour-1 titrated to a maximum dose 1.4 μ g.kg-1 hour-1.

Arm title	Clonidine
------------------	-----------

Arm description:

Participants commenced intravenous infusion of open-label clonidine according to a weight-based dose

regimen as early as possible post randomisation, and within a maximum of two hours.

Bedside clinical staff transitioned patients to achieve sedation with clonidine as quickly as clinically feasible and safe, to replicate the way these drugs were used in routine practice. Additional opiate was used for analgesia using clinical judgement. Once clonidine was established, additional propofol was only used when the maximum α_2 -agonist dose was reached or because cardiovascular or other side-effects limited dose escalation.

For clonidine, the regimen was designed to be equipotent with dexmedetomidine based on known pharmacokinetics and pharmacodynamics. The chosen regimen is similar to that currently used in many UK ICUs as part of routine 'off label' practice. No loading dose was administered. The starting dose was 1.0 μ g/kg/hour titrated to a maximum dose of 2 μ g/kg/hour.

Arm type	Experimental
Investigational medicinal product name	Clonidine - Catapres Ampoules 150 micrograms in 1ml Solution for Injection
Investigational medicinal product code	PL 22824/0009
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

The regimen was designed to be equipotent with dexmedetomidine based on known pharmacokinetics and pharmacodynamics. The chosen regimen is similar to that currently used in many UK ICUs as part of routine 'off label' practice. No loading dose will be administered. The starting dose will be 1.0 μ g.kg⁻¹.hour⁻¹ titrated to a maximum dose of 2 μ g.kg⁻¹.hour⁻¹.

Arm title	Propofol
------------------	----------

Arm description:

Participants received intravenous propofol according to current usual care. The sedation targets, weaning, and sedation discontinuation procedures followed the same clinical targets as for the clonidine and dexmedetomidine groups.

Arm type	Active comparator
Investigational medicinal product name	Propofol 10mg/ml (1%) emulsion for injection or infusion
Investigational medicinal product code	PL 39699/0074
Other name	
Pharmaceutical forms	Emulsion for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

Patients will continue to receive intravenous propofol according to current usual care.

The sedation targets, weaning, and sedation discontinuation procedures will follow the same clinical targets as for the clonidine and dexmedetomidine groups.

Number of subjects in period 1	Dexmedetomidine	Clonidine	Propofol
Started	457	476	471
Completed	457	476	471

Subject analysis sets

Subject analysis set title	Dexmedetomidine
Subject analysis set type	Full analysis

Subject analysis set description:

All participants randomised, analysed according to their allocated treatment group regardless of the treatment actually received, with the exception of the following groups of participants:

- (a) those randomised in error despite ineligibility;
- (b) erroneous duplicate randomisations;
- (c) those fully withdrawing from the trial who also requested that all of their data be deleted;
- (d) exclusions resulting from a serious breach event at site 45 relating to participant consent (14 participants). While professional legal representative consent was obtained for these participants, a notified serious breach arose in relation to processes followed locally to obtain consent to remain in the trial for these incapacitated patients.

Subject analysis set title	Clonidine
Subject analysis set type	Full analysis

Statistical analyses

Statistical analysis title	Primary analysis: Dexmedetomidine versus Propofol
Statistical analysis description:	
For the primary analysis, performed on the full analysis set, a Fine and Gray proportional sub-distribution hazards regression model of time from randomisation to successful extubation was fitted to the data. Results are presented as sub-distribution hazard ratios for each of the dexmedetomidine and clonidine versus usual care comparisons, with corresponding 95% confidence intervals (CI) and p-values from the primary analysis model.	
Comparison groups	Dexmedetomidine v Propofol
Number of subjects included in analysis	928
Analysis specification	Pre-specified
Analysis type	superiority ^[1]
P-value	= 0.196
Method	Fine and Gray proportional sub-distribut
Parameter estimate	Sub-distribution hazard ratio
Point estimate	1.093
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.955
upper limit	1.25

Infections and infestations Septic episode subjects affected / exposed occurrences (all)	Additional description: Septic episode with haemodynamic instability. 1 / 457 (0.22%) 1	0 / 476 (0.00%) 0	0 / 471 (0.00%) 0

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 November 2018	Change of PI at Belfast, addition of 10 sites
16 May 2019	Addition of 13 sites and removal of one (Dorset)
24 October 2019	NIHR logo and statement updated, various protocol updates, new covering letters, 2 new sites added, PI at Hampton Hospitals changed
27 May 2020	Addition of 5 sites, change of PI at Royal Marsden, removal of one site (Royal Free)
24 August 2020	Change in PI at Oxford and St Georges
01 September 2020	SPC updated, Protocol: changes to follow-up, sites 90 day FU, booklets, reduce Q at 30 and 90 days. Covering letters for 90 day site FU. PIS changes: GDPR info included, sites can do 90 days FU
21 March 2022	SPC and Summary product Ch updated. 8 letters, PIS updated and protocol changes including co-enrolment to CTIMPS
31 August 2022	Am 7 documents resubmitted but removed co-enrolment to CTIMPs. SPC and Summary product Ch updated. 8 letters, PIS updated and protocol changes
03 May 2023	1. The protocol has been updated to change the sample size from 1737 to 1437. Additional updates to the protocol include:- a change in trial manager (the previous trial manager has moved onto a new study)- changes to the follow-up duration to truncate the follow up period - an email from the statistician has been included to confirm this will not cause a significant impact on the outcome of the trial- update to the total planned duration of the trial in line with the extension granted by the Funder to complete the trial- changes to section 3.4 Design and analytical/ conceptual framework in line with the revised sample size- changes to Section 10.1 Overview to Health Economic Evaluation to clarify the changes in cost of the drugs during the trials lifespan- changes in section 6.3.1 Replacing Diprivan with Propofol in line with the updated SPC V5.0 (detailed in number 3). - Change to the follow up duration truncating the follow up to 30 days only for participants recruited in October. There is an email from the statistician included to assure there will be no impact from truncating the follow up period.2. Changes to the PIS, Process Evaluation PIS and addition of two letters as detailed further on in the amendment tool.3. SPC updated: we wish to submit SPC V5.0 25042023. The Catapres and Propofol SPC has been updated with no changes to the RSI. The Dexdor SPC has also been updated with a change to the RSI - in section 4.8 (undesirable effects); Added to adverse reactions is diabetes insipidus (endocrine disorder) with unknown frequency. Removed is "Renal and urinary disorders: Polyuria (Not known)

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
------	--------------	--------------

11 March 2020	Recruitment to A2B was suspended at all sites from 11th March 2020 due to the COVID-19 pandemic.	03 June 2020
---------------	--	--------------

Notes:

Limitations and caveats
