

## Clinical trial results:

**A randomized, double-blind, placebo-controlled, parallel-group, 52-week pivotal study to assess the efficacy, safety, and tolerability of dupilumab in patients with moderate-to-severe chronic obstructive pulmonary disease (COPD) with type 2 inflammation (NOTUS)**

### Summary

EudraCT number	2018-001954-91
Trial protocol	DE LV NL LT BG GB FR PT PL ES GR BE HU CZ SK RO
Global end of trial date	27 May 2024

### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	01 November 2023
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	27 May 2024
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To evaluate the efficacy of dupilumab 300 milligrams (mg) every 2 weeks (q2w) in participants with moderate or severe COPD as measured by annualized rate of acute moderate or severe COPD exacerbation (AECOPD).

Protection of trial subjects:

Participants were fully informed of all pertinent aspects of clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the participant and considering the local culture. During the course of the trial, participants were provided with individual participant cards indicating the nature of the trial the participant is participating, contact details and any information needed in the event of a medical emergency. Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	06 July 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Worldwide total number of subjects	935
EEA total number of subjects	415

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	409
From 65 to 84 years	525
85 years and over	1

## Subject disposition

### Recruitment

Recruitment details:

The study was conducted at 329 centers in 29 countries. A total of 2769 participants were screened between 06 July 2020 to 19 April 2023, of which 1834 participants were screen failures. Screen failures were mainly due to not meeting the eligibility criteria.

### Pre-assignment

Screening details:

A total of 935 participants were randomized in a 1:1 ratio to receive either dupilumab 300 mg q2w or matching placebo. Randomization was stratified by country, inhaled corticosteroid (ICS) dose (high-dose ICS [yes/no]) at baseline, and smoking status at screening (current smokers or not).

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer, Assessor

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Placebo

Arm description:

Participants received placebo matched to dupilumab 300 mg SC injection q2w up to 52 weeks.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo for dupilumab was provided in identically matched glass pre-filled syringe to deliver 2 mL which matched dupilumab 300 mg. SC injection sites were alternated between the upper thighs, 4 quadrants of the abdomen or the upper arms, so that the same site was not injected twice during consecutive injections.

<b>Arm title</b>	Dupilumab 300 mg q2w
------------------	----------------------

Arm description:

Participants received dupilumab 300 mg SC injection q2w up to 52 weeks.

Arm type	Experimental
Investigational medicinal product name	Dupilumab
Investigational medicinal product code	
Other name	SAR231893, Dupixent®, REGN668
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Dupilumab was supplied as 150 milligram per milliliter (mg/mL) solution in a pre-filled glass syringe to deliver 300 mg in 2 mL injection. SC injection sites were alternated between the upper thighs, 4 quadrants of the abdomen or the upper arms, so that the same site was not injected twice during consecutive injections.

<b>Number of subjects in period 1</b>	Placebo	Dupilumab 300 mg q2w
Started	465	470
Randomized and treated	465	468
Safety Population	464	469
Completed	422	428
Not completed	43	42
Consent withdrawn by subject	31	23
Adverse event, non-fatal	7	14
Not related to Coronavirus Disease- 2019 (COVID-19)	4	5
Poor compliance to protocol	1	-

## Baseline characteristics

### Reporting groups

## End points

### End points reporting groups

Reporting group title	Placebo
Reporting group description:	
Participants received placebo matched to dupilumab 300 mg SC injection q2w up to 52 weeks.	
Reporting group title	Dupilumab 300 mg q2w
Reporting group description:	
Participants received dupilumab 300 mg SC injection q2w up to 52 weeks.	

### Primary: Annualized Rate of Moderate or Severe Chronic Obstructive Pulmonary Disease (COPD) Exacerbations Over the 52-week Treatment Period

End point title	Annualized Rate of Moderate or Severe Chronic Obstructive Pulmonary Disease (COPD) Exacerbations Over the 52-week Treatment Period
End point description:	
Moderate exacerbations were recorded by the Investigator and defined as AECOPD event that required either systemic corticosteroids (such as intramuscular, intravenous, or oral) and/or antibiotics. Severe exacerbations were also recorded by the Investigator and defined as AECOPD event that required hospitalization or observation for >24 hours in an emergency department/urgent care facility or resulted in death. For both moderate and severe events to be counted as separate events, they were separated by at least 14 days. Annualized event rate was the total number of events that occurred during the 52-week treatment period divided by the total number of participant-years followed in the 52-week treatment period. The Intent-to-treat (ITT) population included all randomized participants analyzed according to the treatment group allocated by randomization.	
End point type	Primary
End point timeframe:	
Baseline (Day 1) to Week 52	

End point values	Placebo	Dupilumab 300 mg q2w		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	465	470		
Units: Exacerbation per participant-year				
number (confidence interval 95%)	1.295 (1.048 to 1.600)	0.859 (0.699 to 1.057)		

### Statistical analyses

Statistical analysis title	Placebo versus Dupilumab 300 mg q2w
Statistical analysis description:	
Derived using negative binomial model with the total number of the events occurring during the 52-week treatment period as the response variable, and treatment group, region (pooled country), ICS dose, smoking status at screening, baseline disease severity, and number of moderate or severe COPD exacerbation events within one year prior to the study as covariates, and log-transformed treatment duration as an offset variable.	
Comparison groups	Dupilumab 300 mg q2w v Placebo

Number of subjects included in analysis	935
Analysis specification	Pre-specified
Analysis type	superiority <sup>[1]</sup>
P-value	= 0.0002
Method	Negative binomial model
Parameter estimate	Risk difference (RD)
Point estimate	-0.435
Confidence interval	
level	95 %
sides	2-sided
lower limit	-0.682
upper limit	-0.188

Notes:

[1] - A hierarchical testing procedure was used to control type I error and handle primary and first 4 secondary endpoints (reported sequentially) analyses at a 2-sided significance level of 0.05.

## Secondary: Change From Baseline in Pre-Bronchodilator Forced Expiratory Volume in 1 Second (FEV1) to Week 12

End point title	Change From Baseline in Pre-Bronchodilator Forced Expiratory Volume in 1 Second (FEV1) to Week 12
-----------------	---

End point description:

The FEV1 was defined as the volume of air exhaled from the lungs in the first second of a forced expiration as measured by spirometer. Spirometry was performed after a wash out period of bronchodilators according to their action duration. Baseline was defined as the last available value up to randomization but prior to the first dose of study treatment. The ITT population included all randomized participants analyzed according to the treatment group allocated by randomization. Only those participants with data collected are reported.

### Secondary: Percentage of Participants With Saint George's Respiratory Questionnaire Improvement $\geq 4$ Points at Week 52

End point title	Percentage of Participants With Saint George's Respiratory Questionnaire Improvement $\geq 4$ Points at Week 52
-----------------	---

End point description:

A responder was defined as a participant with improvement from baseline in SGRQ total score at Week 52 by  $\geq 4$  points. Percentage of participants who achieved a clinically meaningful response in SGRQ total score (improvement by  $\geq 4$  points)/responders are reported. SGRQ is 50-item self-administered questionnaire. Scores by dimension were calculated for 3 domains:symptoms(respiratory symptoms: frequency and severity), activity(activities that cause or are limited by breathlessness) and impacts(social functioning and psychological disturbances due to airway disease). Each question's response had unique empirically derived weight where lowest possible weight was 0 and highest was 100. Total score was obtained by summing all positive responses. Total and domain score was derived from relevant items and converted to a score of 0 to 100; higher score indicating worse health status/health related quality of life. Analysis was performed in ITT population with an opportunity to

## Secondary: Time to First Moderate or Severe Chronic Obstructive Pulmonary Disease Exacerbation Event During the 52-week Treatment Period

End point title	Time to First Moderate or Severe Chronic Obstructive Pulmonary Disease Exacerbation Event During the 52-week Treatment Period
-----------------	---

End point description:

The time to first moderate or severe exacerbation was defined as date of the first event minus randomization date +1. Moderate exacerbations were recorded by the Investigator and defined as AECOPD event that required either systemic corticosteroids (such as intramuscular, intravenous, or oral) and/or antibiotics. Severe exacerbations were recorded by the Investigator and defined as AECOPD event that required hospitalization or observation for >24 hours in an emergency department/urgent care facility or resulted in death. For both moderate and severe events to be counted as separate events, they were separated by at least 14 days. Median time as well as 95% confidence interval was calculated using Kaplan-Meier estimates. The ITT population included all randomized participants analyzed according to the treatment group allocated by randomization.

### Secondary: Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Treatment-Emergent Serious Adverse Events (TESAEs)

End point title	Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Treatment-Emergent Serious Adverse Events (TESAEs)
-----------------	--

#### End point description:

An AE was defined as any untoward medical occurrence in a participant or clinical study participant, temporally associated with the use of study treatment, whether or not considered related to the study treatment. An SAE was defined as any untoward medical occurrence that, at any dose: resulted in death, was life-threatening, required inpatient hospitalization or prolongation of existing hospitalization, resulted in persistent disability/incapacity, was a congenital anomaly/birth defect, was a medically important event. TEAEs were defined as AEs that developed or worsened or became serious during TE period (between the first administration of study treatment to the last administration of the study treatment + 98 days). The Safety population included all participants who actually received at least 1 dose or partial of a dose of the study treatment, analyzed according to the treatment participants actually received.

**Secondary: Number of Participants With Anti-Drug Antibodies (ADA) to Dupilumab**

---

End point title	Number of Participants With Anti-Drug Antibodies (ADA) to Dupilumab
-----------------	---

End point description:

Plasma samples were collected to evaluate antibodies to dupilumab. Pre-existing immunoreactivity is defined as an ADA positive response in the assay at baseline with all post-treatment ADA results negative, or an ADA positive response at baseline with all post-treatment ADA responses less than 4-fold over baseline titer levels. Treatment-emergent response is defined as a positive response in the ADA assay post first dose, when baseline results are negative or missing. Treatment-boosted response is defined as an ADA positive response in the assay post first dose that is greater-than or equal to 4-fold over baseline titer levels, when baseline results are positive. The ADA population included all participants in the safety population who had at least 1 reportable ADA result after first dose of the study treatment.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

AEs, SAEs, all-cause mortality (deaths) were collected from the first dose of study treatment (Day 1) up to the last dose of the study treatment + 98 days, up to 506 days.

Adverse event reporting additional description:

Analysis was performed on the Safety population. 1 participant was exposed to different treatment other than planned (was allocated to placebo arm but inadvertently received dupilumab 300 mg q2w on Day 113). The actual arm was considered as dupilumab 300 mg q2w. In safety analyses, the actual arms are used.

Assessment type	Systematic

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 September 2020	To decrease the study burden on participants, to minimize COVID-19 pandemic-related risks in this vulnerable and elderly population of COPD participants, and to update the adverse event of special interest with the updated Sponsor safety information related to eye disorders.
16 December 2021	To provide flexibility for participant enrollment criteria while maintaining the favorable benefit risk profile and scientific objectives of the study.

Notes:

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
