Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	18 March 2022
Is this the analysis of the primary completion data?	Yes
Primary completion date	26 July 2021
Global end of trial reached?	Yes
Global end of trial date	26 July 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

- To compare the efficacy of ETX2514SUL plus imipenem/cilastatin to colistin plus imipenem/cilastatin in patients with carbapenem-resistant ABC (CRABC) infections in Part A;
- To compare the incidence of nephrotoxicity, as measured by the Risk-Injury-Failure-Loss-End stage renal disease (RIFLE) criteria, of ETX2514SUL to colistin in patients with ABC infections in Part A.

Protection of trial subjects:

All considerations regarding the protection of human subjects were carried out in accordance with the protocol, GCP, ICH Guidelines, the ethical principles that have their origin in the Declaration of Helsinki, and all applicable regulatory requirements. The investigator (according to applicable regulatory requirements) or a person designated by the investigator and under the investigator's responsibility fully informed patients of all pertinent aspects of the clinical trial.

Background therapy: -

Evidence for comparator:

The combination regimen (colistin + imipenem / cilastatin) was considered acceptable as the comparator by the Committee for Medicinal Products for Human Use (CHMP) during the Scientific Advice held with Entasis Therapeutics in 2018.

Imipenem/cilastatin is a broad-spectrum beta-lactam antibiotic of the carbapenem class. Its bactericidal activity is against a broad spectrum of Gram-positive and Gram-negative bacteria, including anaerobic pathogens. The imipenem/cilastatin regimen (1g imipenem/1g cilastatin q6h infused over 60 mins) was considered acceptable by the CHMP as this is the maximum approved dose, making it appropriate for the patient population of the study. The dose adjustments by renal function are those in the EU imipenem SmPC.

Colistin by intravenous (IV) administration is indicated in adults and children including neonates for the treatment of serious infections due to selected aerobic Gram-negative pathogens in patients with limited treatment options. Colistin is administered according to the protocol at 5 mg/kg of colistin base activity (CBA) divided into 2 doses 12 hours apart. Doses are adjusted to ideal body weight in obese patients, and doses do not exceed 300 mg of CBA per day. A single loading dose of 5 mg/kg (total dose not exceeding 300 mg CBA) given IV over 30 to 60 minutes is administered on Day 1. Colistin infusions beyond the loading dose on Day 1 begins 12 hours after the initial loading dose and are infused over 30 minutes. This dose regime was also considered acceptable by the CHMP even if it might not result in all patients receiving a daily colistin dose that would be recommended in the EU SmPC.

Actual start date of recruitment	05 September 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Adults (18-64 years)	98
From 65 to 84 years	87
85 years and over	22

Subject disposition

Recruitment

Recruitment details:

Eighty-five (85) clinical sites were activated, 71 clinical sites screened patients, and 59 clinical sites randomized/enrolled patients in Belarus, Brazil, China, Greece, Hungary, India, Israel, Lithuania, Mexico, Peru, Russia, South Korea, Taiwan, Thailand, Turkey, and the United States (US). From 05 September 2019 to 26 July 2021.

Pre-assignment

Screening details:

A known infection caused by ABC (bacteremia, HABP, VABP, VP, complicated urinary tract infection [cUTI] or acute pyelonephritis [AP], or surgical or post-traumatic wound infections).

A total of 531 patients were screened of which 324 (61%) were screen failures. The primary reason for screen failure was "Failure to meet inclusion/exclusion criteria

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

While study drugs were not masked due to logistical reasons, every attempt was made to maintain the blind for patients, all staff at the site, and the Sponsor or its designees, except for the treatment physician and other immediate healthcare providers.

Clinical outcome assessments were performed by a blinded assessor, in addition to the unblinded Investigator. Whenever possible, the same blinded assessor completed all clinical outcome assessments for a study patient.

Arms

Are arms mutually exclusive?	No
Arm title	Part A - Group 1 - experimental group

Arm description:

Part A was the pivotal, assessor-blind, randomized, comparative portion of the study in patients with documented ABC hospital-acquired bacterial pneumonia (HABP), ventilator-associated bacterial pneumonia (VABP), ventilated pneumonia (VP), or bacteremia. While study drugs were not masked due to logistical reasons, every attempt was made to maintain the blind for patients, all staff at the site, and the Sponsor or its designees, except for the treatment physician and other immediate healthcare providers.

Group 1 (experimental): 1.0 g sulbactam/1.0 g durlobactam IV infused over 3 hours every 6 hours (q6h) plus 1.0 g imipenem/1.0 g cilastatin IV infused over 1 hour q6h;

Arm type	Experimental
Investigational medicinal product name	Sulbactam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1.0 g sulbactam IV infused over 3 hours every 6 hours (q6h).

Day 1 was defined as the first day of study drug administration. The subsequent study days were defined by the number of treatment days thereafter. Treatment days constituted 24 hours of treatment. For those patients with no dose adjustments, the duration of antibiotic treatment with study drug therapy was 28 doses of sulbactam-durlobactam plus 28 doses of imipenem/cilastatin (ie, treatment for 7 days for those without dose adjustments), with a prolongation of therapy up to 14 days if clinically indicated.

Investigational medicinal product name	Durlobactam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1.0 g durlobactam IV infused over 3 hours every 6 hours (q6h).

Day 1 was defined as the first day of study drug administration. The subsequent study days were defined by the number of treatment days thereafter. Treatment days constituted 24 hours of treatment. For those patients with no dose adjustments, the duration of antibiotic treatment with study drug therapy was 28 doses of sulbactam-durlobactam plus 28 doses of imipenem/cilastatin (ie, treatment for 7 days for those without dose adjustments), with a prolongation of therapy up to 14 days if clinically indicated.

Investigational medicinal product name	Imipenem/Cilastatin 500 mg/500 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1.0 g imipenem/1.0 g cilastatin IV infused over 1 hour q6h.

Day 1 was defined as the first day of study drug administration. The subsequent study days were defined by the number of treatment days thereafter. Treatment days constituted 24 hours of treatment. For those patients with no dose adjustments, the duration of antibiotic treatment with study drug therapy was 28 doses of sulbactam-durlobactam plus 28 doses of imipenem/cilastatin (ie, treatment for 7 days for those without dose adjustments), with a prolongation of therapy up to 14 days if clinically indicated.

Arm title	Part A - Group 2 - control group
------------------	----------------------------------

Arm description:

Group 2 (control group): 2.5 mg/kg colistin IV infused over 30 minutes every 12 hours (after an initial loading dose of colistin 2.5 to 5 mg/kg) plus 1.0 g imipenem/1.0 g cilastatin IV infused over 1 hour q6h.

Arm type	Active comparator
Investigational medicinal product name	COLOMYCIN INJECTION 2 million IU/vial
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Colistin was administered at a daily dose of 5 mg/kg of CBA divided into 2 doses 12 hours apart. Doses were adjusted to ideal body weight in obese patients. Patients who weighed <60 kg with normal renal function received a flat dose of 300 mg CBA or 9 MIU/day. A single loading dose of 2.5 to 5 mg/kg (total dose not exceeding 300 mg CBA or 9 MIU and following local standard of care) given IV over 3 to 6 minutes (or according to standard of care) was administered on Day 1. Colistin infusions beyond the loading dose on Day 1 began 12 hours after the initial loading dose and were infused over 30 minutes.

Investigational medicinal product name	Imipenem/Cilastatin 500 mg/500 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1.0 g imipenem/1.0 g cilastatin IV infused over 1 hour q6h.

Day 1 was defined as the first day of study drug administration. The subsequent study days were defined by the number of treatment days thereafter. Treatment days constituted 24 hours of treatment.

For those patients with no dose adjustments, the duration of antibiotic treatment with study drug therapy was 28 doses of sulbactam-durlobactam plus 28 doses of imipenem/cilastatin (ie, treatment for 7 days for those without dose adjustments), with a prolongation of therapy up to 14 days if clinically indicated.

Arm title	Part B - Group 3
------------------	------------------

Arm description:

Part B (Group 3) was the open-label, supportive portion of the study that included patients known to have HABP, VABP, VP, and/or bacteremia infections associated with ABC organisms resistant to colistin or polymyxin B, who failed a colistin or polymyxin B regimen prior to study entry or were on acute renal replacement therapy, and patients with infections due to colistin- or polymyxin B-resistant ABC with sources of infection other than HABP, VABP, VP, and/or bacteremia.

Group 3: 1.0 g ETX2514/1.0 g sulbactam IV infused over 3 hours q6h plus 1.0 g imipenem/1.0 g cilastatin IV infused over 1 hour q6h.

Arm type	Experimental
Investigational medicinal product name	Sulbactam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1.0 g sulbactam IV infused over 3 hours every 6 hours (q6h).

Day 1 was defined as the first day of study drug administration. The subsequent study days were defined by the number of treatment days thereafter. Treatment days constituted 24 hours of treatment. For those patients with no dose adjustments, the duration of antibiotic treatment with study drug therapy was 28 doses of sulbactam-durlobactam plus 28 doses of imipenem/cilastatin (ie, treatment for 7 days for those without dose adjustments), with a prolongation of therapy up to 14 days if clinically indicated.

Investigational medicinal product name	Durlobactam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1.0 g durlobactam IV infused over 3 hours every 6 hours (q6h).

Day 1 was defined as the first day of study drug administration. The subsequent study days were defined by the number of treatment days thereafter. Treatment days constituted 24 hours of treatment. For those patients with no dose adjustments, the duration of antibiotic treatment with study drug therapy was 28 doses of sulbactam-durlobactam plus 28 doses of imipenem/cilastatin (ie, treatment for 7 days for those without dose adjustments), with a prolongation of therapy up to 14 days if clinically indicated.

Investigational medicinal product name	Imipenem/Cilastatin 500 mg/500 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1.0 g imipenem/1.0 g cilastatin IV infused over 1 hour q6h.

Day 1 was defined as the first day of study drug administration. The subsequent study days were defined by the number of treatment days thereafter. Treatment days constituted 24 hours of treatment. For those patients with no dose adjustments, the duration of antibiotic treatment with study drug therapy was 28 doses of sulbactam-durlobactam plus 28 doses of imipenem/cilastatin (ie, treatment for 7 days for those without dose adjustments), with a prolongation of therapy up to 14 days if clinically indicated.

Number of subjects in period 1^[1]	Part A - Group 1 - experimental group	Part A - Group 2 - control group	Part B - Group 3
Started	92	89	28
Completed	69	61	22
Not completed	23	28	6
Adverse event, serious fatal	15	21	4
Consent withdrawn by subject	2	3	1
No growth of ABC	2	1	-
Others	1	1	1
Adverse event, non-fatal	-	1	-
Transferred to other arm/group	1	1	-
Prohibited concomitant medication	1	-	-
Protocol deviation	1	-	-

Notes:

[1] - The number of subjects transferring in and out of the arms in the period are not the same. It is expected the net number of transfers in and out of the arms in a period, will be zero.

Justification: Two (2) patients were transferred from Part A to part B. These patients were analyzed at each arm until/ from the time point of transfer. The number of patients who started in Part B (28) already includes the 2 patients transferred from Part A. the For this reason, the number of subjects transferring in and out of the arms in the period are not the same.

Subject analysis set title	CRABC m-MITT Population in Part A-Group 1
----------------------------	---

Subject analysis set type	Modified intention-to-treat
---------------------------	-----------------------------

Subject analysis set description:

For Part A, the CRABC m-MITT Population included patients who met m-MITT criteria and had a baseline ABC organism that was confirmed to be carbapenem-resistant (MIC of imipenem/meropenem ≥ 8 ug/mL) by the central laboratory or by the local laboratory if the central laboratory was not able to characterize the isolate for any reason. Patients were excluded from the CRABC m-MITT Population if they had isolates that were deemed by the central laboratory to be resistant to sulbactam-durlobactam (MIC >4 ug/mL) or colistin (MIC ≥ 4 ug/mL), if their blood culture or respiratory samples were collected more than 72 hours prior to randomization, if they were transferred from Part A to Part B, or if they were enrolled with infections other than ABC pneumonia or bloodstream infection (ie, ABC infections other than HABP, VABP, VP, and bacteremia). Patients were enrolled until there were at least 120 patients in the CRABC Microbiologically Modified Intent-to-Treat (MITT) (m-MITT) Population in Part A.

Subject analysis set title	CRABC m-MITT Population in Part A-Group 2
----------------------------	---

Subject analysis set type	Modified intention-to-treat
---------------------------	-----------------------------

Subject analysis set description:

Statistical analyses

Statistical analysis title	non-inferiority assessment
----------------------------	----------------------------

Statistical analysis description:

The non-inferiority assessment was based on the 2-sided 95% CIs computed using a continuity-corrected Z-statistic for the difference ([sulbactam-durlobactam + imipenem/cilastatin] – [colistin + imipenem/cilastatin]) in 28-day all-cause mortality rates between the treatment groups. Non-inferiority was concluded if the upper limit of the 2-sided 95% CI was less than +20%. Superiority was concluded if the upper limit of the 2-sided 95% CI was less than 0.

Comparison groups	CRABC m-MITT Population in Part A-Group 2 v CRABC m-MITT Population in Part A-Group 1

Primary: Incidence of nephrotoxicity (RIFLE) - Part A

End point title	Incidence of nephrotoxicity (RIFLE) - Part A ^[1]
-----------------	---

End point description:

Analysis of patients with nephrotoxicity as measured by RIFLE criteria at any post-baseline visit based on the Investigator's opinion for the Safety Population for Part A, excluding patients with chronic hemodialysis at baseline baseline.

End point type	Primary
----------------	---------

End point timeframe:

At any post-baseline visit

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: Even if all 3 arms, Part A (Group 1 and 2) and Part B (Group 3) are all part of the baseline period, Part B data was summarized separately from Part A using descriptive statistics.

End point values	Part A - Group 1 - experimental group	Part A - Group 2 - control group		
Subject group type	Reporting group	Reporting group

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse event monitoring starts from the time the patient consents to the study until they complete the trial.

Adverse event reporting additional description:

A Treatment-emergent adverse event (TEAE) was defined as an adverse event (AE) that occurred on or after the administration of the first dose of study drug.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 April 2019	<p>Protocol Amendment 1 (version 2.0, dated 29 April 2019) was instituted before any enrollment and updated the Clinical Study Protocol in the following ways:</p> <ul style="list-style-type: none">• In response to queries from the Spanish regulatory authority, the following clarifications were made:<ul style="list-style-type: none">o Language regarding the informed consent process and use of a legally authorized representative was updated and expanded; ando Rationale was added regarding the timing of the initiation of Part B of the study, namely, that PK from Part A must be verified prior to beginning Part B. In addition, language was added to allow for patients who are responding to therapy to remain in Part A even with a colistin resistant culture.• In response to queries from the Chinese regulatory authority, intense PK sampling was conducted for the first approximately 20 patients enrolled at sites in China Mainland. Due to this change, stratification for Part A also included geography (China Mainland versus Rest of World);• Removed neutropenia requirements from diagnosis of bacteremia in Part A-specific inclusion criteria;• Language for entry into Part B was updated to allow for patients who previously failed a polymyxin-based regimen and additional clarifications were made to clarify the patient population for Part B;• Text was added to inclusion criterion 4 to clarify definition of enrollment as prior to first dose of study drug;• Removed required elevated serum lactate level from exclusion criterion 5;• Clarified that "study drug" in exclusion criterion 25 refers to durlobactam;• Language added from imipenem/cilastatin package insert to note instructions for patients who experienced focal tremors, myoclonus, or seizures at any point during the study;• Text updated throughout that, in the event of a discrepancy between the assessment of the blinded assessor and unblinded Investigator, the assessment from the blinded assessor would prevail;• Clarification added for discontinuation due to severe li

14 January 2020	<p>Protocol Amendment 2 (version 3.0, dated 14 January 2020) updated the Clinical Study Protocol in the following ways:</p> <ul style="list-style-type: none"> • The target population was expanded to allow patients with VP into Parts A and B of the study; • The following changes were made to the inclusion and exclusion criteria: <ul style="list-style-type: none"> o The definition for bacteremia was simplified; o Qualifying scores for the APACHE II and SOFA were made uniform for both Parts A and B; o Language was added allowing ultrasound for diagnosis; o Pleural fluid was added as an acceptable source for specimen collection; o Contraception language was updated based on the nonclinical study package as follows: <ul style="list-style-type: none"> -Female contraception language was updated to require only 1 highly effective method of contraception; and -Male contraception language was removed. o Acceptable comorbidities and permitted treatments were updated. • The secondary efficacy endpoint of attributable mortality was changed to all mortality; • Resistance to carbapenems was added to the exploratory efficacy endpoints; • The sample size was increased as required to allow for the interim analysis; • Language was added to clarify that an adjudication committee may be organized for endpoint adjudication; • Clarified that specimens were cultured at the local lab with pure cultures of isolates sent to the central laboratory; • Language was added to allow patients receiving antibiotic prophylaxis for immunosuppression; • The timeframe and process for retesting following an indeterminate or negative result for the BPP were defined; • Clarified the timeframe for AE collection was to begin with signing of the main informed consent, not limited scope informed consent; and • Clarified that if the first 3 of Hy's Laws were met it must be reported as an SAE.
17 December 2020	<p>Protocol Amendment 3 (version 4.0, dated 17 December 2020) updated the Clinical Study Protocol in the following ways:</p> <ul style="list-style-type: none"> • The Part B-specific inclusion criterion requiring patients to have acute kidney injury and were receiving renal replacement therapy at study entry was removed, so that patients who only met this criterion were not enrolled in Part B. Instead, this criterion was added as 1 of the potential requirements for patients with HABP, VABP, VP, or bacteremia, and for patients with cUTI, AP, or surgical or post-traumatic wound infections; • COVID-19 infection without clinical improvement was added to exclusion criteria as an example of a pulmonary disease that would preclude evaluation of a therapeutic response; • Clarification was added for the imipenem/cilastatin dose adjustments for patients with severe renal impairment; • Language of the required repeat imaging for the chest X-ray, MRI, CT scan, or ultrasound obtained >48 hours prior to randomization, was updated to avoid confusion at study sites; • Language was updated to clarify that an ABC positive culture collected within 72 hours prior to randomization rather than screening, was acceptable for enrollment; • Mortality in the CRABC m-MITT Population was removed from the secondary efficacy endpoints since the primary efficacy endpoint for the study was 28-day all-cause mortality in the CRABC m-MITT Population in Part A; • The definition of clinical indeterminate was updated; • Language was added to clarify that the local laboratory could be used to confirm if the baseline ABC organism was carbapenem resistant when the central laboratory was not able to characterize the isolate for any reason; • Additional requirements for the exclusion of patients from the CRABC m-MITT Population were added; • After the conversation with the Food and Drug Administration (FDA) (reference ID: 4667476), the non-inferiority margin was increased, and as a result, the total sample size for Part A and the sam
