

Clinical trial results:

A phase 3, double-blind, randomized, placebo-controlled study to assess the safety and efficacy of a single oral administration of nolasiban to increase ongoing pregnancy rate following fresh single blastocyst transfer resulting from IVF

Analysis stage	Final
Date of interim/final analysis	24 October 2020
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	19 November 2020
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective is to confirm the efficacy of a single oral 900 mg dose of nolasiban versus placebo to increase the ongoing clinical pregnancy rate at 10 weeks post-embryo transfer (ET) day.

Protection of trial subjects:

This study was to be performed in accordance with the protocol, with the ethical principles that have their origin in the Declaration of Helsinki, with the International Council for Harmonization (ICH) Harmonized Tripartite Guideline for Good Clinical Practice (GCP), with the European Union Clinical Trial Directive, and with all applicable local laws and regulations.

Before initiation of the study at a given site, written approval of the protocol, the Informed Consent Form (ICF), and any information presented to potential subjects had to be obtained from the appropriate Independent Ethics Committee (IEC).

Background therapy:

Subjects in this study were undergoing controlled ovarian hyperstimulation (COH) in preparation for IVF/ICSI according to the clinical center's practice, following a gonadotropin releasing hormone (GnRH) antagonist protocol with or without pre-treatment with an oral contraceptive pill or E2.

Final follicular maturation was to be performed with one administration of human chorionic gonadotropin (hCG) and luteal support was to be provided using vaginal micronized natural progesterone at 600 mg daily starting from the morning after oocyte pick-up (OPU) until at least the Week 6 visit (for subjects with positive pregnancy test at the Week 2 visit).

Evidence for comparator: -

Actual start date of recruitment	29 November 2018
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Subject disposition

Recruitment

Recruitment details:

First patient screened: 29Nov2018

Last patient completed: 30Sep2019

Last neonatal follow-up data: 26May2020

Last infant follow-up data: 24Oct2020

Study conducted at 47 study sites in 10 countries [Belgium (3 sites), Canada (3), Czech Republic (10), Denmark (4), Estonia (3), Germany (6), Hungary (3), Poland (6), Russia (3), and Spain (6)].

Pre-assignment

Screening details:

A total of 1264 potential subjects were screened, of whom 810 subjects were randomised. Three subjects who were all randomized to placebo were not treated, thus 807 subjects were included in the full analysis set (FAS). One subject was randomised to placebo but received nolasiban.

Period 1

Period 1 title	Treatment period
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Blinding implementation details:

As soon as the last subject completed Week 10 and the database was locked, the treatment groups were unblinded to the Sponsor; subjects and investigators remained blinded until the end of the 6-month infant follow-up.

Arms

Are arms mutually exclusive?	Yes
Arm title	Nolasiban 900 mg

Arm description:

A single oral dose of 900 mg nolasiban was to be administered to the subject at the investigational site about 4 hours prior to the embryo transfer (ET).

Arm type	Experimental
Investigational medicinal product name	nolasiban
Investigational medicinal product code	OBE001
Other name	
Pharmaceutical forms	Dispersible tablet
Routes of administration	Oral use

Dosage and administration details:

On the day of ET, subjects received a single oral dose of 900 mg nolasiban dispersed in water, approximately 4 hours prior to the transfer procedure,

Arm title	Placebo
------------------	---------

Arm description:

A single oral dose of placebo was to be administered to the subject at the investigational site about 4 hours prior to the embryo transfer (ET).

Arm type	Placebo
Investigational medicinal product name	placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Dispersible tablet
Routes of administration	Oral use

Dosage and administration details:

On the day of ET, subjects received a single oral dose of placebo dispersed in water, approximately 4

hours prior to the transfer procedure.

Number of subjects in period 1^[1]	Nolasiban 900 mg	Placebo
Started	398	409
Completed	161	160
Not completed	237	249
Not pregnant	205	212
Adverse event, non-fatal	31	34
No embryo transfer	-	1
Other	-	1
Subject's request	1	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Three subjects who were all randomised to placebo were not treated (2 due to a lack of good quality embryos, and 1 due to mistaken treatment with atosiban), thus 807 subjects were included in the FAS and SAS.

Period 2

Period 2 title	Follow-up period 1
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor

Blinding implementation details:

As soon as the last subject completed Week 10 and all data were locked, the treatment groups were unblinded to the Sponsor.

Subjects and investigators remained blinded until the end of the 6-month infant follow-up period 2.

Arms

Are arms mutually exclusive?	Yes
Arm title	Nolasiban 900 mg treated

Arm description:

All Women Follow-up (AWFU) Set: All subjects, treated with nolasiban, who took part in the pregnancy outcome follow-up. This was the analysis set for the analysis of pregnancy outcome data.

Arm type	Experimental
Investigational medicinal product name	nolasiban
Investigational medicinal product code	OBE001
Other name	
Pharmaceutical forms	Dispersible tablet
Routes of administration	Oral use

Dosage and administration details:

On the day of ET, subjects received a single oral dose of 900 mg nolasiban dispersed in water, approximately 4 hours prior to the transfer procedure,

Secondary: Neonatal outcomes - AI Set

End point title	Neonatal outcomes - AI Set
End point description:	
Analysis of neonatal health data - condition at birth: In the All Infants (AI) set, 54.5% were male and 45.5% were female (placebo [P]: 58.4% and 41.6%; nolasiban [N]: 50.6% and 49.4%, respectively). Median weight at birth was similar in both groups (P: 3214.0 g; N: 3230.0 g). The minimum weight was 900 g in the placebo group and 1080 g in the nolasiban group. Median height was the same in both groups (51.0 cm) with mean height similar in both groups (P: 50.87 cm; N: 51.20 cm). Median head circumference was also the same in both groups (34.0 cm) with similar mean values (P: 33.81 cm; N: 33.88 cm). The median Apgar scores at 1 min and 5 min were identical in both groups (P: 9.0; N: 10.0). Congenital malformations or birth defects were reported in 6 infants in each treatment group (approx. 3.8%). Neonatal illness was reported with similar frequency in both groups (P: 6.8%; N 7.6%), as was abnormal examination of infant by a paediatrician (P: 5.0%; N: 5.7%).	
End point type	Secondary

Adverse events

Adverse events information

Timeframe for reporting adverse events:

TEAEs occurring in subjects from the day of study drug administration until 28 days after delivery.
Only SAEs were collected for the fetuses / neonates (from birth up to 28 days).

Adverse event reporting additional description:

Mother: All AEs from informed consent until Week 10. From Week 10 until birth, only AEs which could affect foetal outcome or AEs that the investigator suspected were related to IMP.

Foetus: only AEs resulting in SAEs (until birth).

Neonate (from birth up to 28 days): only AEs resulting in SAEs (until 28 days).

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 November 2018	<ul style="list-style-type: none">- Specification that 3 PK samples were to be collected at 3.5 h, 5 h, and ≥ 7 h (up to a maximum of 72 h) following nolasiban/placebo administration.- Specification that nolasiban concentration was to be measured in plasma (instead of serum).- Clarification that the PK analysis set would include only those subjects who received active study medication (i.e., nolasiban).- Clarification that population PK analyses would be described and reported separately.- Specification that blood samples for measurement of P4 and E2 were to be collected on the day before/of hCG injection.- Addition of a schematic diagram to clarify the assessments and procedures to be performed at the baseline visit.- Specification that analysis of rates of live birth and pregnancy loss would be performed using a gestational age limit of 22 weeks in addition to the analyses using 20-week and 24-week limits.- Addition of ASQ-3 questionnaire completion at 12 months.- Specification that miscarriage or foetal death in utero after 10 weeks of pregnancy was to be considered an SAE, and that spontaneous abortions before 10 weeks were to be reported as AEs and as "pregnancy and obstetrical outcomes of interest."- Introduction of the category of "pregnancy and obstetrical outcomes of interest," with resulting change to the eCRF AE forms.- Description of the destruction of (un)used IMP.
07 August 2019	<ul style="list-style-type: none">- Specification that PK would also be analysed for nolasiban metabolites and clarification that PK results were to be reported separate from the main CSR.- Removal of the analysis of live birth at 20 weeks of gestation.- Clarification of the definition of pregnancy loss.- Addition of the requirement that any congenital anomalies be confirmed by a dysmorphologist.- Addition of the collection of information from an infant physical examination at 12 months.- Introduction of separate study objectives, endpoints, and analyses for the US health authorities
02 December 2019	<ul style="list-style-type: none">- Removal of the collection of the ASQ-3 and infant physical examination at 12-months.- Removal of US objectives, endpoints and analysis which were introduced in amendment 2 (protocol version 3.0).- Clarification that the verification of congenital anomalies by a dysmorphologist is managed by the Sponsor.- Correction to categories of pre-term births.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Of 807 subjects treated, 321 had confirmed pregnancies at Week 10. Follow-up (FU) data were provided for 329 fetuses. Pregnancies resulted in live birth for 313 subjects, assuming +ve outcome in case of loss to FU. Neonatal FU data on 319 infants.
