

Clinical trial results:

A Phase 3, Multi-Center, Randomized, Double-Blind, Placebo-Controlled Study to Assess the Efficacy and Safety of Apremilast (CC-10004) in Pediatric Subjects From 6 Through 17 Years of Age With Moderate to Severe Plaque Psoriasis

Summary

EudraCT number	2018-002918-12

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	27 March 2023
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	27 March 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study was to evaluate the clinical efficacy of apremilast compared with placebo in children and adolescents (ages 6 through 17 years) with moderate to severe plaque psoriasis.

Protection of trial subjects:

This study was conducted in accordance with International Council for Harmonisation (ICH) Good Clinical Practice (GCP) regulations/guidelines and in accordance with the general ethical principles outlined in the Declaration of Helsinki.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	19 December 2018
Long term follow-up planned	Yes
Long term follow-up rationale	Efficacy, Safety
Long term follow-up duration	4 Years
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Canada: 16
Country: Number of subjects enrolled	Belgium: 7
Country: Number of subjects enrolled	Czechia: 5
Country: Number of subjects enrolled	France: 7
Country: Number of subjects enrolled	Italy: 11
Country: Number of subjects enrolled	Russian Federation: 103
Country: Number of subjects enrolled	Spain: 31
Country: Number of subjects enrolled	Israel: 7
Country: Number of subjects enrolled	United States: 58
Worldwide total number of subjects	245
EEA total number of subjects	61

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37	0

wk	
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	101
Adolescents (12-17 years)	144
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Participants were enrolled into this study at sites in Belgium, Canada, Czech Republic, France, Israel, Italy, Russia, Spain, and the United States.

Pre-assignment

Screening details:

Screening tests and procedures were performed up to 35 days preceding randomization.

Period 1

Period 1 title	Placebo-controlled Phase
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Placebo
------------------	---------

Arm description:

In the placebo-controlled phase, participants who were randomized to placebo received placebo twice daily (BID) for 16 weeks. At Week 16, participants in the placebo group were switched to apremilast based on baseline weight. Participants who completed the study or discontinued the study early could have opted to enter the 14-week observational follow up.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Tablets

Arm title	Apremilast
------------------	------------

Arm description:

In the placebo-controlled phase, participants who were randomized to apremilast who were 20 to < 50 kg received apremilast 20 mg twice daily (BID) for 16 weeks, and participants \geq 50 kg received apremilast 30 mg BID for 16 weeks. Participants who completed the study or discontinued the study early could have opted to enter the 14-week observational follow up.

Arm type	Experimental
Investigational medicinal product name	Apremilast
Investigational medicinal product code	
Other name	Otezla®
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Tablets

Number of subjects in period 1	Placebo	Apremilast

Notes:

[1] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: Includes participants who received apremilast 20mg during the apremilast exposure period.

[2] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: Includes participants who received apremilast 20mg during the apremilast exposure period.

[3] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: Includes participants who received apremilast 30mg during the apremilast exposure period.

[4] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: Includes participants who received apremilast 30mg during the apremilast exposure period.

Primary: Percentage of Participants with a Static Physician Global Assessment (sPGA) Response at Week 16

End point title	Percentage of Participants with a Static Physician Global Assessment (sPGA) Response at Week 16
-----------------	---

End point description:

The sPGA is the assessment by the Investigator of the overall disease severity of plaque psoriasis at the time of evaluation. The sPGA is a 5-point scale ranging from 0 (clear) to 4 (severe), incorporating an assessment of the severity of the three primary signs of the disease: erythema, scaling and plaque elevation. The results presented are for the percentage of participants with a sPGA response. An sPGA response was defined as a score of clear (0) or almost clear (1) with at least a 2-point reduction from baseline at Week 16. Measured in the intent-to-treat (ITT) population, which included all participants who were randomized.

Secondary: Percentage Change from Baseline in Body Surface Area (BSA) Affected by Psoriasis at Week 16

End point title	Percentage Change from Baseline in Body Surface Area (BSA) Affected by Psoriasis at Week 16
End point description: BSA is a measurement of involved skin of the whole body affected by psoriasis, which ranges from 0% to 100%. Positive percentage change from baseline indicates that a greater BSA was affected by psoriasis. A negative percentage change from baseline indicates that a lesser BSA was affected by psoriasis. Measured in the intent-to-treat (ITT) population, which included all participants who were randomized.	
End point type	Secondary
End point timeframe: Baseline and Week 16

Secondary: Percentage of Participants who Achieved a Children's Dermatology Life Quality Index (CDLQI) Score of 0 or 1 at Week 16

End point title	Percentage of Participants who Achieved a Children's Dermatology Life Quality Index (CDLQI) Score of 0 or 1 at Week 16
-----------------	--

End point description:

The CDLQI is designed to measure the impact of skin disease on children's quality of life. The CDLQI measures how much the participant's psoriasis has affected them over the last week, and includes 10

questions with possible answers ranging from not at all (score of 0) to very much (score of 3). The CDLQI total score ranged from 0 (no effect on the participant's life) to 30 (extremely large effect on the participant's life). The results presented are for the percentage of participants who achieved a total CDLQI score of 0 or 1 at Week 16. Measured in participants in the intent-to-treat (ITT) population (which included all participants who were randomized), with a baseline CDLQI Score ≥ 2 .

Statistical analyses

No statistical analyses for this end point

Secondary: Number of Participants with Suicidal Ideation or Behavior per the Columbia-Suicide Severity Rating Scale (C-SSRS) During the Placebo-controlled Phase

End point title	Number of Participants with Suicidal Ideation or Behavior per the Columbia-Suicide Severity Rating Scale (C-SSRS) During the Placebo-controlled Phase
-----------------	---

End point description:

The C-SSRS is a questionnaire that is used to assess suicidal ideation and behavior. The C-SSRS questionnaire measures suicidal ideation, intensity of ideation, and suicidal behaviors. Results presented are for the number of participants who recorded suicidal ideation or behavior on the C-SSRS. Measured in the Safety Population, which included all randomized participants who received at least 1 dose of investigational product.

Secondary: Number of Female Participants at Stage I-V of Sexual Development per Tanner Staging of Sexual Development

End point title	Number of Female Participants at Stage I-V of Sexual Development per Tanner Staging of Sexual Development
End point description: The Tanner Staging of sexual development is a scale of physical development as children transition into adolescence and then adulthood. The scale defines physical measurements of development based on characteristics, such as the size of the breasts, genitals, testicular volume, and growth of pubic hair. The scale ranges from stage I (pre-adolescent) to stage V (adult development). The results presented are for the number of participants at stage I-V of development. Measured in the Safety Population, which included all randomized participants who received at least 1 dose of investigational product and had available data for the endpoint. As pre-specified, results are presented based on initial treatment received.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Up to a maximum of 52 weeks

Adverse event reporting additional description:

All-cause mortality is reported for all enrolled participants. Serious and other adverse events are reported in the Safety Population, which included all randomized participants who received at least 1 dose of investigational product. As pre-specified, data are presented per treatment received.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
12 April 2019	<ul style="list-style-type: none">- Added an inclusion criterion for baseline minimum allowable body mass index- Added a specific body mass index parameter as a reason for mandatory participant withdrawal- Revised hemoglobin ranges for participant eligibility- Added a note to contraception options to clarify options considered "highly effective contraception" may differ per local guidelines/regulations
23 September 2019	<ul style="list-style-type: none">- Replaced depictions of investigational product blister card packaging to align with redesigned packaging- Added text informing of switch from blister card investigational product to bottles during the apremilast-extension phase- Revised platelet ranges for participant eligibility- Removed requirement for reporting of pregnancies of partners of male participants
01 May 2020	<ul style="list-style-type: none">- References to Celgene were replaced with Amgen- Updated to align with Amgen Global Drug Safety and Amgen Product Complaint Reporting processes- Updated to include instructions for paper reporting of serious adverse events- Added Sample Serious Adverse Event Form, Pregnancy Notification Form, and Lactation Notification Form to align with Amgen processes
26 August 2021	<ul style="list-style-type: none">- Reduced the study sample size from at least 230 randomized participants to at least 180 randomized participants- Updated the power calculations based on the change in sample size- Added language regarding reporting of serious adverse events
17 December 2021	<ul style="list-style-type: none">- Reverted the study sample size from at least 180 randomized participants to the original protocol goal of at least 230 randomized participants- Updated the power calculations based on the change in sample size

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
19 March 2020	Effective 19 March 2020, screening and enrollment were temporarily paused at all participating countries/sites to limit potential COVID-19 exposure for study participants, sponsor employees, and staff at clinical study sites. In June 2020, Amgen made a decision to lift the pause on screening and enrollment, based on an assessment that took into account the state of the pandemic, the study design, participant safety, public health risks, the benefit-risk balance, and the burden on healthcare systems. After the pause was lifted, enrollment resumed over the following months in a staggered fashion across countries and study sites, depending on the status of COVID-19 regionally as well as local restrictions and guidance.	01 June 2020

Notes:

Limitations and caveats
