Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Interim
Date of interim/final analysis	04 August 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	04 August 2020
Global end of trial reached?	No

Notes:

General information about the trial

Main objective of the trial:

This open-label, single arm study evaluated the safety of obinutuzumab administered as a short duration infusion (SDI; target 90-minute infusion) during cycle 2 and from cycle 2 onwards in combination with chemotherapy in participants with previously untreated advanced follicular lymphoma (FL).

Protection of trial subjects:

All study subjects were required to read and sign and Informed Consent Form.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	26 February 2019
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	3 Months
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Brazil: 19
Country: Number of subjects enrolled	Japan: 27
Country: Number of subjects enrolled	United States: 13
Country: Number of subjects enrolled	Germany: 11
Country: Number of subjects enrolled	Netherlands: 6
Country: Number of subjects enrolled	Spain: 28
Country: Number of subjects enrolled	United Kingdom: 9
Worldwide total number of subjects	113
EEA total number of subjects	45

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0

Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	69
From 65 to 84 years	43
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

Participants were enrolled at 35 sites across 7 countries.

Pre-assignment

Screening details:

Of the all participants population (114 participants), one participant did not receive the study treatment, thus the safety-evaluable population included 113 participants.

Period 1

Period 1 title	Induction Phase
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	All Participants
-----------	------------------

Arm description:

Participants were enrolled in an induction phase and received 6-8 cycles of obinutuzumab, combined with 6 or 8 cycles of standard chemotherapy (cyclophosphamide, doxorubicin, vincristine, and prednisone/prednisolone/methylprednisolone [CHOP - 21-day cycle) or bendamustine (28-day cycle), or cyclophosphamide, vincristine, and prednisone/prednisolone/methylprednisolone [CVP - 21-day cycle]). Participants received an additional two doses of obinutuzumab on Days 8 and 15 of Cycle 1. The investigator was free to choose the chemotherapy for each participant.

Arm type	Experimental
Investigational medicinal product name	Obinutuzumab
Investigational medicinal product code	
Other name	Gazyva
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

Obinutuzumab was administered as a 1000 mg IV infusion on Day 1, 8 and 15 during Cycle 1, and on Day 1 of subsequent cycles, for 6-8 cycles. Each cycle is 21 or 28 days long depending on the chemotherapy regimen allocated.

Investigational medicinal product name	Bendamustine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

Bendamustine was administered on Days 1 and 2 for Cycles 1–6 at a dose of 90 mg/m²/day, for six 28-day cycles.

Investigational medicinal product name	Cyclophosphamide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

Cyclophosphamide 750 milligrams per square metre (mg/m²), administered intravenously (IV) on Day 1 of each 21-day cycle, for six cycles for CHOP treatment or eight cycles for CVP treatment.

Investigational medicinal product name	Doxorubicin
Investigational medicinal product code	
Other name	

Pharmaceutical forms	Infusion
Routes of administration	Intravenous use
Dosage and administration details:	
Doxorubicin 50 mg/m ² IV, administered on Day 1 of each 21-day cycle, for six cycles.	
Investigational medicinal product name	Prednisone/Prednisolone/Methylprednisolone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use
Dosage and administration details:	
Prednisone 100 mg (or equivalent prednisolone or methylprednisolone), administered orally on Days 1-5 of each 21-day cycle, for six cycles for CHOP treatment or eight cycles for CVP treatment.	
Investigational medicinal product name	Vincristine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use
Dosage and administration details:	
Vincristine 1.4 mg/m ² (maximum 2 mg) IV, administered on Day 1 of each 21-day cycle, for six cycles for CHOP treatment or eight cycles for CVP treatment.	

Number of subjects in period 1	All Participants
Started	113
Completed	62
Not completed	51
Physician decision	2
Consent withdrawn by subject	3
Adverse Event	5
Progressive Disease	4
Other Continuing on Study	34
Various reasons	3

Period 2

Period 2 title	Maintenance
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Maintenance
Arm description: Participants who achieved a partial response (PR) or complete response (CR) following the induction phase received obinutuzumab maintenance therapy. 1000 mg of obinutuzumab as single agent was administered as an SDI every 8 weeks (+ or - 10 days) for 2 years or until disease progression).	
Arm type	Experimental
Investigational medicinal product name	obinutuzumab
Investigational medicinal product code	
Other name	Gazyva
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

1000 mg of obinutuzumab was administered as an SDI every 8 weeks (+ or - 10 days) for 2 years or until disease progression).

Number of subjects in period 2^[1]	Maintenance
Started	56
Started Follow Up	17
Completed Follow-up	11
Completed	0
Not completed	56
Consent withdrawn by subject	1
Adverse Event	1
Death	1
Progressive Disease	1
Continuing on study	52

Notes:

[1] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: Some participants will have completed the treatment of a phase, but not yet had the first treatment of the next phase.

Baseline characteristics

Reporting groups

Reporting group title	All Participants

End points

End points reporting groups

Reporting group title	All Participants
-----------------------	------------------

Reporting group description:

Participants were enrolled in an induction phase and received 6-8 cycles of obinutuzumab, combined with 6 or 8 cycles of standard chemotherapy (cyclophosphamide, doxorubicin, vincristine, and prednisone/prednisolone/methylprednisolone [CHOP - 21-day cycle) or bendamustine (28-day cycle), or cyclophosphamide, vincristine, and prednisone/prednisolone/methylprednisolone [CVP - 21-day cycle]). Participants received an additional two doses of obinutuzumab on Days 8 and 15 of Cycle 1. The investigator was free to choose the chemotherapy for each participant.

Reporting group title	Maintenance
-----------------------	-------------

Reporting group description:

Participants who achieved a partial response (PR) or complete response (CR) following the induction phase received obinutuzumab maintenance therapy. 1000 mg of obinutuzumab as single agent was administered as an SDI every 8 weeks (+ or - 10 days) for 2 years or until disease progression).

Subject analysis set title	Short duration infusion population
----------------------------	------------------------------------

Subject analysis set type	Sub-group analysis
---------------------------	--------------------

Subject analysis set description:

This population included all enrolled participants who did not experience a Grade 3 or 4 IRR during Cycle 1 (i.e. at any of the 3 Cycle 1 infusions) and received obinutuzumab as an SDI at Cycle 2.

Subject analysis set title	Follow-up
----------------------------	-----------

Subject analysis set type	Per protocol
---------------------------	--------------

Subject analysis set description:

Participants with stable disease (SD) or progressive disease (PD) as best response after induction therapy discontinued study treatment and underwent a safety follow-up visit at 3 months (90 days (+ or - 10 days)). All participants were followed up at 3 months (90 days (+ or - 10 days)) from the time of the last dose of study treatment.

Primary: Percentage of Grade ≥ 3 Infusion-Related Reactions (IRRs) During Cycle 2 in Patients Who Had Previously Received Obinutuzumab at the Standard Infusion Rate During Cycle 1 Without Experiencing a Grade 3 or 4 IRR

End point title	Percentage of Grade ≥ 3 Infusion-Related Reactions (IRRs) During Cycle 2 in Patients Who Had Previously Received Obinutuzumab at the Standard Infusion Rate During Cycle 1 Without Experiencing a Grade 3 or 4 IRR ^[1]
-----------------	--

End point description:

IRRs were defined as all adverse events (AEs) that occurred during or within 24 hours from the end of study treatment infusion and were judged as related to infusion of study treatment components by the investigator. The Short Duration Infusion (SDI) population included all enrolled participants who did not experience a Grade 3 or 4 IRR during cycle 1 (i.e. at any of the three Cycle 1 infusions), received obinutuzumab given at the standard rate only during Cycle 1, and received obinutuzumab as an SDI at cycle 2.

End point type	Primary
----------------	---------

End point timeframe:

Within 24 hours from the end of study treatment infusion of Day 1 in Cycle 2 (1 cycle: 21 or 28 days depending on the chemotherapy selected)

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: This endpoint is presented with a point estimate and a 95% confidence interval according to Clopper&Pearson

End point values	Short duration infusion population			
Subject group type	Subject analysis set			
Number of subjects analysed	97			
Units: Percentage of Participants				
number (confidence interval 95%)	0 (0.00 to 3.73)			

Statistical analyses

No statistical analyses for this end point

Secondary: Percentage of Participants With Adverse Events (AEs)

End point title	Percentage of Participants With Adverse Events (AEs)
-----------------	--

End point description:

An AE was defined as any untoward medical occurrence in a clinical investigation participant who was administered a pharmaceutical product, regardless of causal attribution. An AE was therefore any unfavourable and unintended sign (including an abnormal laboratory finding, for example), symptom, or disease temporally associated with the use of a pharmaceutical product, whether or not considered related to the pharmaceutical product. Pre-existing conditions which worsened during the study, recurrence of an intermittent medical condition, deterioration in a laboratory value or other clinical test or were related to a protocol-mandated intervention were also considered AEs. Grading was completed according to the National Cancer Institute Common Terminology Criteria for Adverse Events (NCI CTCAE) Version 5.0. The safety population included all participants who received at least one dose of obinutuzumab.

End point type	Secondary
----------------	-----------

End point timeframe:

Cycle 7 (n=45)	4.4			

Statistical analyses

No statistical analyses for this end point

Secondary: Time to IRR From Infusion to Onset of the IRR During Cycle 2

End point title	Time to IRR From Infusion to Onset of the IRR During Cycle 2
-----------------	--

End point description:

Time to IRR (of any grade) in Cycle 2 was defined as the time from the start of infusion (i.e., start date/time of infusion of the first component of study treatment) in Cycle 2 to the onset of the IRR (of any grade) during Cycle 2. The SDI population included all enrolled participants who did not experience a Grade 3 or 4 IRR during cycle 1 (i.e. at any of the three Cycle 1 infusions), received obinutuzumab given at the standard rate only during Cycle 1, and received obinutuzumab as an SDI at cycle 2. For this outcome measure, only one participant was analyzed. 9999999 = Standard deviation (SD) is not available because only 1 participant had the time to IRR recorded and the SD for one value is not defined.

End point type	Secondary
----------------	-----------

End point timeframe:

From infusion to onset of IRR during Cycle 2 (1 cycle: 21 or 28 days depending on the chemotherapy selected)

End point values	Short duration infusion population			
Subject group type	Subject analysis set			
Number of subjects analysed	97			
Units: Hours				
arithmetic mean (standard deviation)	11.800 (\pm 9999999)

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
17 October 2018	This amendment was created to clarify that participants with prior radiotherapy for FL were excluded from the study; clarification that rescanning of participants was possible at any time; the guidance on the use of premedication before obinutuzumab infusion to reduce the risk of IRRs in participants was updated; additional guidance was provided on hepatitis B reactivation management; clarification was added that the assessment of LVEF was only required for participants who received obinutuzumab with CHOP chemotherapy; assessments of B symptoms at the end-of-infusion, during maintenance, and at the end-of maintenance was not required and that it was only mandatory at screening; clarifications were added to state the assessments of weight at follow-up and response assessments at screening were not required; clarification that hepatitis B virus DNA PCR testing would be performed every 3-4 weeks for participants with prior HBV infection of who are carriers of HBV; the study title was updated to change "Gazyva" to "obinutuzumab" since the trade name differs depending on the country.
06 December 2018	This protocol was amended to state that the addition to the steroid premedication, participants would also receive premedication with an anti-histamine and antipyretic before the first cycle of obinutuzumab given as an SDI.
12 September 2019	The protocol was amended to allow participants who experienced a first Grade 3 IRR during SDI dosing to continue to receive SDI dosing during their current and next infusion. The statistical analysis plan was updated to include earlier reporting of the efficacy data at the EOI therapy. Clarification that the SDI population was used for the analysis of the secondary safety endpoint and the primary endpoint analysis. Exclusion criteria was updated to exclude participants with known HTLV-1 infection. Updates to the inclusion criteria allowed participants treated with corticosteroids for reasons other than chemotherapy and premedication to reduce the risk of IRRs as long as the dose didn't exceed 30 mg/day and to clarify that the frequency and period of DNA testing in participants with occult or prior HBV infection and with undetectable HBV DNA would be at least every 3 months for willing participants. The secondary safety endpoint was revised to clarify that it included IRRs linked to any study treatment. The following was clarified: participants who began a prohibited therapy would discontinue the study treatment and the end of induction or end of maintenance visit was performed before any new therapy was started, that 'study treatment' referred to obinutuzumab and chemotherapy during induction and obinutuzumab alone during maintenance, that Beta-2 microglobulin testing would be conducted at screening and EOI, the infusion rates at which obinutuzumab would be restarted following IRRs; premedication that would be given for IRRs, participants with a Grade 4 IRR during induction would discontinue study treatment (and not discontinue the study). This amendment also included additional guidance on when maintenance therapy began, managing suspected anaphylactic reactions, how often to assess vital signs, on tumor and bone marrow assessments and how participant and provided-reported outcome instruments would be administered, the timing of assessments and follow-up period.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
