

Clinical trial results:

Dose-dependent effects of propranolol on extinction learning and return of fear

Summary

EudraCT number	2018-003409-25
Trial protocol	BE
Global end of trial date	16 June 2021

Results information

Result version number	v2 (current)
This version publication date	22 September 2022
First version publication date	19 March 2022
Version creation reason	<ul style="list-style-type: none">• Correction of full data set In the previous version, US expectancy data had not been treated for missing values (unlike our other outcome measures). We treated the data, repeated the analysis, and provide the new results here. It should be noted that the pattern of results did not change.

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 October 2021
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	16 June 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

In our previous study (2016-002392-10; S59302), we found evidence that 40 mg oral administration of Propranolol HCl 60 min prior to extinction training attenuates fear responding and facilitates extinction. Propranolol administration did not prevent the return of fear, however, we did not test for return of fear in absence of the drug. The main aim of the present study is to investigate whether propranolol has a dose-dependent effect on extinction learning, and whether this further prevents the return of fear, in absence of the drug.

Protection of trial subjects:

During all testing days, the experimenter remained in an adjacent room and had one-way visual contact with the subjects at all times. Subjects were informed that they could stop the experiment at any point, without giving reason and without being penalized. At the end of the experiment, we provided the subjects with the contact details of several support services in case they needed further assistance after completion of the experiment or had the urge to talk to somebody (other than the researchers) about it. These people were prepared to talk to the subjects immediately or get back to them (e.g., contact by e-mail). Contact information included clinical psychologists from within, as well as from outside our department, the student health services, and a call center where you can speak to someone anonymously.

Background therapy:

None.

Evidence for comparator:

We used a placebo, a commonly used comparator. Placebos were used as they did not contain any active substance that could exert effects upon consumption. Placebo pills were manufactured to be perceptually matched to the active drug (Propranolol). All medication was packaged in the same neutral package that was only labeled with a subject number. Labelling was done by the university hospital pharmacy. These steps were taken as to maintain a double-blind experimental procedure, thus preventing any undue influence on the results from expectations/demands of the subjects or the researcher.

Actual start date of recruitment	04 March 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Belgium: 152
Worldwide total number of subjects	152
EEA total number of subjects	152

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	152
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Healthy, adult subjects were recruited from 04/03/2019 until 16/06/2021 through a database of potential research participants, managed by the KU Leuven Faculty of Psychology and Educational Sciences (Experiment Management System, EMS, accessible at psykuleuven.sona-systems.com).

Pre-assignment

Screening details:

Subjects were screened on Days 1 and 2, before being assigned to the arms of the study. Day 1 screening: 1) Medical exclusion criteria, 2) The Anxiety Sensitivity Index questionnaire (ASI), and 3) Non-differentiation between CS+ and CS-, on the last block of acquisition, in FPS. Day 2 screening: Medical exclusion criteria. See pre-assignment period

Pre-assignment period milestones

Number of subjects started	152
Number of subjects completed	73

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Medical exclusion criteria (Day 2): 3
Reason: Number of subjects	Participant cancelled appointment: 3
Reason: Number of subjects	Screening questionnaire cutoff (ASI): 11
Reason: Number of subjects	Medical exclusion criteria (Day 1): 20
Reason: Number of subjects	Non-differentiation CS+/CS- (end of Day 1): 42

Period 1

Period 1 title	Overall period (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Blinding implementation details:

An external collaborator not involved in the study randomized subjects into three groups matched on age, gender, trait anxiety (STAI-T), and anxiety sensitivity (ASI).

Arms

Are arms mutually exclusive?	Yes
Arm title	80 mg Propranolol

Arm description:

In this arm, subjects were administered 80 mg Propranolol on Day 2 of the experiment, 60 minutes prior to extinction learning.

Arm type	Experimental
Investigational medicinal product name	Propranolol EG - 80 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Subjects were orally administered 2 tablets of 40 mg Propranolol EG simultaneously, for a combined dose of 80 mg.

Arm title	40 mg Propranolol
Arm description: In this arm, subjects were administered 40 mg Propranolol on Day 2 of the experiment, 60 minutes prior to extinction learning.	
Arm type	Experimental
Investigational medicinal product name	Propranolol EG - 40 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use
Dosage and administration details: Subjects were orally administered 1 tablet of 40 mg Propranolol EG and 1 placebo tablet simultaneously.	
Arm title	Placebo
Arm description: In this arm, subjects were administered placebo on Day 2 of the experiment, 60 minutes prior to extinction learning.	
Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use
Dosage and administration details: Subjects were orally administered 2 placebo tablets, simultaneously.	

Number of subjects in period 1^[1]	80 mg Propranolol	40 mg Propranolol	Placebo
Started	25	24	24
Completed	24	24	24
Not completed	1	0	0
Excluded for not following instructions	1	-	-

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 152 subjects were originally recruited. 79 subjects were excluded during the pre-assignment period (see Subject disposition). 73 subjects were thus included in the baseline period.

Baseline characteristics

Reporting groups

Adverse events

Adverse events information

Timeframe for reporting adverse events:

The researcher had to report all serious adverse events immediately to the sponsor except for those that the protocol identifies as not requiring immediate reporting.

Adverse event reporting additional description:

At the end of each testing day, subjects had to fill out an adverse events form which asked about possible adverse reactions during/following the experiment in general (e.g., dizziness, pain, strong negative feelings, etc.).
