

## Clinical trial results:

### A Phase 3, Randomized, Placebo-controlled, 12-week Double-blind Study, followed by a Non-Controlled Extension Treatment Period, to Assess the Efficacy and Safety of Fezolinetant in Women Suffering from Moderate to Severe Vasomotor Symptoms (Hot Flashes) Associated with Menopause

#### Summary

EudraCT number	2018-003529-27
Trial protocol	GB LV CZ HU
Global end of trial date	23 April 2021

#### Results information

Result version number	v1
This version publication date	18 April 2022
First version publication date	18 April 2022

#### Trial information

##### Trial identification

Sponsor protocol code	2693-CL-0302
-----------------------	--------------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT04003142
WHO universal trial number (UTN)	-

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	23 April 2021
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	23 April 2021
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

The primary objective of this study is to evaluate the efficacy of fezolinetant vs placebo on the frequency and severity of moderate to severe VMS.

Protection of trial subjects:

This clinical study was written, conducted and reported in accordance with the protocol, International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use (ICH) Good Clinical Practice (GCP) Guidelines, and applicable local regulations, including the European Directive 2001/20/EC, on the protection of human rights, and with the ethical principles that have their origin in the Declaration of Helsinki. Astellas ensures that the use and disclosure of protected health information (PHI) obtained during a research study complies with the federal, national and/or regional legislation related to the privacy and protection of personal information.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	10 July 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Canada: 33
Country: Number of subjects enrolled	Czechia: 14
Country: Number of subjects enrolled	Latvia: 14
Country: Number of subjects enrolled	Poland: 108
Country: Number of subjects enrolled	Spain: 8
Country: Number of subjects enrolled	United Kingdom: 1
Country: Number of subjects enrolled	United States: 323
Worldwide total number of subjects	501
EEA total number of subjects	144

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	496
From 65 to 84 years	5
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

Postmenopausal women participants 40 to 65 years of age who had moderate to severe VMS & seeking treatment or relief for VMS associated with menopause, confirmed as menopausal, had to have 7 to 8 moderate to severe VMS per day within the 10 days prior to randomization & who met the inclusion criteria & none of the exclusion criteria were enrolled.

### Pre-assignment

Screening details:

Prior to randomization, participants had a screening period during which a minimum 10-day collection of baseline VMS frequency and severity assessments were performed.

### Period 1

Period 1 title	Double-blind Period (DBP) (12 weeks)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Double-blind Period: Placebo

Arm description:

Participants received fezolinetant matching placebo (two fezolinetant matching placebo tablets) orally, once daily (QD) up to week 12 during double-blind treatment period.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received fezolinetant matching placebo orally, QD.

<b>Arm title</b>	Double-blind Period: Fezolinetant 30 mg
------------------	---

Arm description:

Participants received fezolinetant 30 mg (one 30 mg fezolinetant tablet and one placebo tablet) orally, QD up to week 12 during double-blind treatment period.

Arm type	Experimental
Investigational medicinal product name	Fezolinetant
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received fezolinetant 30 mg orally, QD.

<b>Arm title</b>	Double-blind Period: Fezolinetant 45 mg
------------------	---

Arm description:

Participants received fezolinetant 45 mg (one 30 mg tablet and one 15 mg tablet) orally, QD up to week 12 during double-blind treatment period.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Fezolinetant
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received fezolinetant 45 mg orally, QD.

Number of subjects in period 1	Double-blind Period: Placebo	Double-blind Period: Fezolinetant 30 mg	Double-blind Period: Fezolinetant 45 mg
Started	168	166	167
Treated	167	166	167
Completed	151	152	155
Not completed	17	14	12
Adverse event, non-fatal	1	1	2
Protocol Deviation	1	5	-
Miscellaneous	2	1	2
Lost to follow-up	2	1	2
Withdrawal by subject	11	6	6

## Period 2

Period 2 title	Extension Period (EP) (40 weeks)
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Not blinded

## Arms

Are arms mutually exclusive?	No
<b>Arm title</b>	Double-blind: Fezolinetant 30 mg/Extension: Fezolinetant 30 mg

Arm description:

Participants received fezolinetant 30 mg (one 30 mg fezolinetant tablet and one placebo tablet) orally, QD up to week 12 during double-blind treatment period followed by fezolinetant 30 mg orally, QD from week 13 up to Week 52 during extension treatment period.

Arm type	Experimental
Investigational medicinal product name	Fezolinetant
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received fezolinetant 30 mg orally, QD.

<b>Arm title</b>	Double-blind: Fezolinetant 45 mg/Extension: Fezolinetant 45 mg
------------------	--

Arm description:

Participants received fezolinetant 45 mg (one 30 mg tablet and one 15 mg tablet) orally, QD up to week 12 during double-blind treatment period followed by fezolinetant 45 mg orally, QD from week 13 up to Week 52 during extension treatment period.

Arm type	Experimental
Investigational medicinal product name	Fezolinetant
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received fezolinetant 45 mg orally, QD

<b>Arm title</b>	Double-blind Period:Placebo/Extension Period:Fezolinetant 30mg
------------------	--

Arm description:

Participants who received placebo during double-blind treatment period were re-randomized to receive fezolinetant 30 mg orally, QD from week 13 up to week 52 during extension treatment period.

Arm type	Experimental
Investigational medicinal product name	Fezolinetant
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received fezolinetant 30 mg orally, QD.

<b>Arm title</b>	Double-blind Period:Placebo/Extension Period:Fezolinetant 45mg
------------------	--

Arm description:

Participants who received placebo during double-blind treatment period were re-randomized to receive fezolinetant 45 mg orally, QD from week 13 up to week 52 during extension treatment period.

Arm type	Experimental
Investigational medicinal product name	Fezolinetant
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received fezolinetant 45 mg orally, QD

<b>Number of subjects in period 2</b>	Double-blind: Fezolinetant 30 mg/Extension: Fezolinetant 30 mg	Double-blind: Fezolinetant 45 mg/Extension: Fezolinetant 45 mg	Double-blind Period:Placebo/Ext ension Period:Fezolinetant
Started	152	154	76

## Primary: Change From Baseline in The Mean Frequency of Moderate to Severe VMS at Week 4

End point title	Change From Baseline in The Mean Frequency of Moderate to Severe VMS at Week 4
-----------------	--

### End point description:

The frequency of moderate to severe VMS was the number of moderate to severe VMS per 24 hours. A daily frequency per week was derived by taking the mean of the data over 7 days. Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed). Baseline was the average number of moderate to severe VMS per 24 hours based on the non-missing values in the 10 days immediately prior to randomization.

End point type	Primary
----------------	---------

### End point timeframe:

Baseline and week 4

Analysis Population: Full analysis set (FAS) (consisted of all randomized participants who took at least 1 dose of study intervention) with available data at specified time point.

#### **Primary: Change From Baseline in The Mean Severity of Moderate to Severe VMS at Week 4**

End point title	Change From Baseline in The Mean Severity of Moderate to Severe VMS at Week 4
-----------------	---

End point description:

Severity of moderate to severe VMS per day at post baseline visit was calculated as follows:  

$$[(\text{number of mild hot flashes per day} \times 1) + (\text{number of moderate hot flashes per day} \times 2) + (\text{number of severe hot flashes per day} \times 3)] / \text{Total number of daily mild/moderate/severe hot flashes}$$
Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed). Severity was zero for participants that had no mild or moderate or severe VMS. Higher scores indicates greater severity.

Analysis Population: FAS population with available data at specified time point.

### **Primary: Change From Baseline in The Mean Severity of Moderate to Severe VMS at Week 12**

End point title	Change From Baseline in The Mean Severity of Moderate to Severe VMS at Week 12
-----------------	--

End point description:

Severity of moderate to severe VMS per day at post baseline visit was calculated as follows:

$$[(\text{number of mild hot flashes per day} \times 1) + (\text{number of moderate hot flashes per day} \times 2) + (\text{number of severe hot flashes per day} \times 3)] / \text{Total number of daily mild/moderate/severe hot flashes}$$

Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed).

Severity was zero for participants that had no mild or moderate or severe VMS. Higher scores indicates greater severity.

Analysis Population: FAS population with available data at specified time point.

### **Secondary: Change From Baseline in The Mean Patient-reported Outcomes Measurement Information System Sleep Disturbance – Short Form 8b (PROMIS SD SF 8b) Total Score at Week 12**

End point title	Change From Baseline in The Mean Patient-reported Outcomes Measurement Information System Sleep Disturbance – Short Form 8b (PROMIS SD SF 8b) Total Score at Week 12
-----------------	--

End point description:

The PROMIS SD SF 8b assesses self-reported sleep disturbance over the past 7 days and includes perceptions of restless sleep; satisfaction with sleep; refreshing sleep; difficulties sleeping, getting to sleep or staying asleep; amount of sleep; and sleep quality. Because it assesses the participants experience of sleep disturbance, the measure does not focus on specific sleep-disorder symptoms or ask patients to report objective measures of sleep (e.g., total amount of sleep, time to fall asleep and amount of wakefulness during sleep). Responses to each of the 8 items range from 1 (no disturbed sleep) to 5 (disturbed sleep), and the range of possible summed raw scores is 8 to 40. Higher scores on the PROMIS SD SF 8b indicate more of the disturbed sleep.

Analysis Population: FAS population with available data at specified time point.

## Secondary: Change from Baseline in The Mean Frequency of Moderate, and Severe VMS to Each Study Week Up to Week 12

End point title	Change from Baseline in The Mean Frequency of Moderate, and Severe VMS to Each Study Week Up to Week 12
-----------------	---

End point description:

The frequency of moderate to severe VMS was the number of moderate to severe VMS per 24 hours. A daily frequency per week was derived by taking the mean of the data over 7 days. Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed). Baseline was the average number of moderate to severe VMS per 24 hours based on the non-missing values in the 10 days immediately prior to randomization.

Analysis Population: FAS population with available data at specified time point.

Point estimate	-2.56
Confidence interval	
level	95 %
sides	2-sided
lower limit	-3.61
upper limit	-1.52
Variability estimate	Standard error of the mean
Dispersion value	0.53

Notes:

[38] - LSM, SE, CI, & p-values come from MMRM analysis of covariance model with CFB as dv & trt group, wk & smoking status as factors, with bl measurement & bl wt as covariates, as well as an interaction of trt by wk & interaction of bl measurement by wk.

## Secondary: Change from Baseline in The Mean Severity of Moderate, and Severe VMS to Each Study Week Up to Week 12

End point title	Change from Baseline in The Mean Severity of Moderate, and Severe VMS to Each Study Week Up to Week 12
-----------------	--

End point description:

Severity of moderate to severe VMS per day at post baseline visit was calculated as follows:

$$[(\text{number of mild hot flashes per day} \times 1) + (\text{number of moderate hot flashes per day} \times 2) + (\text{number of severe hot flashes per day} \times 3)] / \text{Total number of daily mild/moderate/severe hot flashes}$$

Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed).

Severity was zero for participants that had no mild or moderate or severe VMS. Higher scores indicates greater severity.

Analysis Population: FAS population with available data at specified time point.

### Secondary: Mean Percent Change in The Frequency of Moderate And Severe VMS From Baseline to Each Study Week Up to Week 12

End point title	Mean Percent Change in The Frequency of Moderate And Severe VMS From Baseline to Each Study Week Up to Week 12
-----------------	--

End point description:

The frequency of moderate to severe VMS was the number of moderate to severe VMS per 24 hours. A daily frequency per week was derived by taking the mean of the data over 7 days. Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed). Baseline was the average number of moderate to severe VMS per 24 hours based on the non-missing values in the 10 days immediately prior to randomization.

Analysis Population: FAS population with available data at specified time point.

### Secondary: Number of Participants With Percent Reduction of $\geq 50\%$ in the Mean Frequency of Moderate and Severe VMS From Baseline to Each Study Week Up to Week 12

End point title	Number of Participants With Percent Reduction of $\geq 50\%$ in the Mean Frequency of Moderate and Severe VMS From Baseline to Each Study Week Up to Week 12
-----------------	--

End point description:

The frequency of moderate to severe VMS was the number of moderate to severe VMS per 24 hours. A daily frequency per week was derived by taking the mean of the data over 7 days. Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed). Baseline was the average number of moderate to severe VMS per 24 hours based on the non-missing values in the 10 days immediately prior to randomization. Participant has  $\geq 50\%$  reduction from baseline to each post baseline week for the frequency of moderate to severe VMS.

Number of subjects included in analysis	334
Analysis specification	Pre-specified
Analysis type	superiority
P-value	< 0.001 <sup>[106]</sup>
Method	Regression, Logistic
Parameter estimate	Odds ratio (OR)
Point estimate	2.09

Confidence interval

level	95 %
sides	2-sided
lower limit	1.351
upper limit	3.252

Notes:

[106] - Based on logistic regression with treatment group and smoking status (current vs former/never) as factors and mean frequency of vasomotor symptoms at baseline as a covariate.

**Secondary: Number of Participants With Mean Percent Reduction of 100% in The Mean Frequency of Moderate, and Severe VMS From Baseline to Each Study Week Up to Week 12**

End point title	Number of Participants With Mean Percent Reduction of 100% in The Mean Frequency of Moderate, and Severe VMS From Baseline to Each Study Week Up to Week 12
End point description:	
<p>The frequency of moderate to severe VMS was the number of moderate to severe VMS per 24 hours. A daily frequency per week was derived by taking the mean of the data over 7 days. Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed). Baseline was the average number of moderate to severe VMS per 24 hours based on the non-missing values in the 10 days immediately prior to randomization. Participant has 100% reduction from baseline to each post baseline week for the frequency of moderate to severe VMS.</p>	
End point type	Secondary
End point timeframe:	
Baseline and weeks 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 and 12	
Analysis Population: FAS population with available data at specified time point.

## Secondary: Change from Baseline in The Mean Frequency of Moderate, and Severe VMS at Week 24

End point title	Change from Baseline in The Mean Frequency of Moderate, and Severe VMS at Week 24
-----------------	---

End point description:

The frequency of moderate to severe VMS was the number of moderate to severe VMS per 24 hours. A daily frequency per week was derived by taking the mean of the data over 7 days. Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed). Baseline was the average number of moderate to severe VMS per 24 hours based on the non-missing values in the 10 days immediately prior to randomization.

Analysis Population: FAS population with available data at specified time point.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline and 24 weeks of fezolinetant exposure (week 36 for arms Placebo/Fezolinetant 30 mg and Placebo/Fezolinetant 45 mg)

End point values	Double-blind Period:Placebo/ Extension Period:Fezoline tant 30mg	Double-blind Period:Placebo/ Extension Period:Fezoline tant 45mg	Double-blind: Fezolinetant 30 mg/Extension: Fezolinetant 30 mg	Double-blind: Fezolinetant 45 mg/Extension: Fezolinetant 45 mg
Subject group type	Reporting group	Reporting group	Subject analysis set	Subject analysis set
Number of subjects analysed	62	60	131	134
Units: VMS per day

## Statistical analyses

No statistical analyses for this end point

## Secondary: Change from Baseline in The Mean Severity of Moderate, and Severe VMS at Week 24

End point title	Change from Baseline in The Mean Severity of Moderate, and Severe VMS at Week 24
-----------------	--

End point description:

Severity of moderate to severe VMS per day at post baseline visit was calculated as follows:

[(number of mild hot flashes per day x 1) + (number of moderate hot flashes per day x 2) + (number of severe hot flashes per day x 3)]/Total number of daily mild/moderate/severe hot flashes

Moderate VMS was defined as sensation of heat with sweating/dampness, but was able to continue activity. If at night, participant woke up because she was feeling hot and/or was sweating, but no action was necessary other than rearranging the bed sheets. Severe VMS was defined as sensation of intense heat with sweating, caused disruption of activity. If at night, participant woke up hot and was sweating and needed to take action (e.g., remove layers of clothes, open the window, or get out of bed).

Severity was zero for participants that had no mild or moderate or severe VMS. Higher scores indicates greater severity.

Analysis Population: FAS population with available data at specified time point.

End point type	Secondary

## Statistical analyses

**Secondary: Number of Participants in Each Category of Patient's Global Impression of Change (PGIC) in VMS at Each Visit**

End point title	Number of Participants in Each Category of Patient's Global Impression of Change (PGIC) in VMS at Each Visit <sup>[131]</sup>
-----------------	---

## End point description:

The PGI is comprised of 2 companion 1-item PRO measures analogous to the Clinical Global Impression (CGI) scales. These measures provide brief, stand-alone global assessments prior to and after initiating a study medication. Patient-perceived change from the initiation of treatment (PGI-C)-VMS is used to evaluate meaningful within-person changes over time in VMS. This measure provides patient-perceived change from the initiation of treatment.

The PGI-C VMS asks: "Compared to the beginning of this study, how would you rate your HFs/night sweats now?" Subject ratings range from (1) much better to (7) much worse. Participant ratings range from 1=much better, 2= moderately better, 3= a little better, 4= no change, 5= a little worse, 6= moderately worse, 7= much worse.

Analysis Population: FAS population with available data at specified time point.

End point type	Secondary
----------------	-----------

## End point timeframe:

Weeks 4, 12, 16, 20, 24, 28, 32, 36, 40, 44, 52 of fezolinetant exposure (weeks 16, 24, 28, 32, 36, 40, 44, 48 and 52 for arms Placebo/Fezolinetant 30 mg and Placebo/Fezolinetant 45 mg)

## Notes:

[131] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: There was no pre-specified statistical analysis for this endpoint.

## Statistical analyses

No statistical analyses for this end point

## Secondary: Number of Participants With Adverse Events

End point title	Number of Participants With Adverse Events <sup>[132]</sup>
End point description:	
An AE is any untoward medical occurrence in a participant administered a study drug, & which does not necessarily have to have a causal relationship with treatment. An AE can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom or disease temporally associated with use of a medicinal product (mp) whether or not considered related to the mp. An AE is considered "serious" if it results in death, is life-threatening, results in persistent or significant disability/incapacity or substantial disruption of the ability to conduct normal life functions, Results in congenital anomaly or birth defect, requires inpatient hospitalization or leads to prolongation of hospitalization, hospitalization for treatment/observation/examination caused by AE is to be considered as serious, discontinuation due to increases in liver enzymes, other medically important events. TEAE was defined as an AE observed from first dose date up to 21 days after last dose.	
End point type	Secondary
End point timeframe:	
From first dose date up to 21 days after last dose (to 55 weeks)	
Analysis Population: Safety analysis set consisted of all randomized participants who took at least 1 dose of study intervention.	

Notes:

[132] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: There was no pre-specified statistical analysis for this endpoint.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

From first dose date up to 21 days after last dose (to 55 weeks)

Assessment type	Systematic
-----------------	------------

### Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	v23.0
--------------------	-------

### Reporting groups

Reporting group title	Double-blind Period: Placebo
-----------------------	------------------------------

Reporting group description:

Participants received fezolinetant matching placebo (two fezolinetant matching placebo tablets) orally, once daily (QD) up to week 12 during double-blind treatment period.

Reporting group title	Double-blind : Placebo/Extension : Fezolinetant 45 mg
-----------------------	---

Reporting group description:

Participants who received placebo during double-blind treatment period were re-randomized to receive fezolinetant 45 mg orally, QD from week 13 up to week 52 during extension treatment period.

Reporting group title	Double-blind : Placebo/Extension : Fezolinetant 30 mg
-----------------------	---

Reporting group description:

Participants who received placebo during double-blind treatment period were re-randomized to receive fezolinetant 30 mg orally, QD from week 13 up to week 52 during extension treatment period.

Reporting group title	Double-blind: Fezolinetant 30 mg/Extension: Fezolinetant 30 mg
-----------------------	--

Reporting group description:

Participants received fezolinetant 30 mg (one 30 mg fezolinetant tablet and one placebo tablet) orally, QD up to week 12 during double-blind treatment period followed by fezolinetant 30 mg orally, QD from week 13 up to Week 52 during extension treatment period.

Reporting group title	Double-blind: Fezolinetant 45 mg/Extension: Fezolinetant 45 mg
-----------------------	--

Reporting group description:

Participants received fezolinetant 45 mg (one 30 mg tablet and one 15 mg tablet) orally, QD up to week 12 during double-blind treatment period followed by fezolinetant 45 mg (one 30 mg tablet and one 15 mg tablet) orally, QD from week 13 up to Week 52 during extension treatment period.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
17 May 2019	<p>The changed included:</p> <p>The study title is updated to convey that the second phase of the study is a non-controlled extension period.</p> <p>The number of subjects to be enrolled is increased from 300 to 450, and the sample size justification parameters are updated to reflect a possible 20% discontinuation rate instead of a 32% rate.</p> <p>An additional treatment arm is added to include a 45 mg dose of fezolinetant.</p> <p>The schedule of assessments is updated to include a mammogram at week 52/end of treatment/early discontinuation and an endometrial biopsy following study discontinuation. Further details are provided regarding the circumstances under which these procedures are performed.</p> <p>The screening serology panel is updated to include testing for antibody against hepatitis B antigen and antibody to hepatitis B core antigen.</p> <p>The dose rationale is updated with additional information about Study ESN364_HF_205 and results regarding the potential for drug-induced liver injury.</p> <p>The length of time prior to screening in which a normal/negative or not clinically significant mammogram may have been performed is increased to within 12 months of trial enrollment.</p> <p>The schedule of assessments is updated to include 2 additional study visits (2b and 5b).</p> <p>The schedule of assessments and pharmacokinetics assessment sections are updated to include the addition of blood draws for pharmacokinetic analysis in subjects with a signal of elevated transaminases who are returning for a repeat hepatic abnormality testing blood draw.</p> <p>Details are added for the reporting of drug-induced liver damage and it is clarified that such events are to be characterized as serious adverse events (SAEs).</p> <p>The statistical analysis is updated to accommodate inclusion of a second dosing cohort.</p>

01 July 2020	<p>The changes included:</p> <p>Inclusion criterion #4 was updated to remove with or without hysterectomy from the bilateral oophorectomy screening criteria. Inclusion criteria #8 and #10 are aligned to account for the exclusion of subjects who have had a hysterectomy. Inclusion criterion #9 is updated to specify that the endometrial biopsy obtained at screening must be considered evaluable; this criterion is now required for all subjects.</p> <p>Alternate measures that may be implemented due to site closures related to the COVID-19 pandemic are added to the protocol. These include telemedicine conferences (by telephone), home healthcare services, and laboratory assessments performed at local laboratories. It is noted that subjects who screen fail due to a COVID-19 pandemic study suspension and have an evaluable endometrial biopsy will not require a repeat biopsy if they rescreen.</p> <p>Exclusion criteria #6 and #7 are updated so that they apply to all subjects, not just subjects with a uterus, and the exception for endometrial thickness less than 4 mm is removed from exclusion criterion #7. Exclusion criterion #20 is added to exclude subjects who have had partial or full hysterectomies.</p> <p>Language is added to specify that the screening endometrial biopsy must be evaluable. Retest biopsies may only be performed for insufficient material or unevaluable biopsies, and a maximum of one retest biopsy during screening is allowed. It is noted that subjects will be allowed into the study based on the primary endometrial result/diagnosis, but a second and tertiary diagnosis will also be reported.</p> <p>Adverse events (AEs) of abuse liability, depression, wakefulness and effect on memory are added to the protocol as AEs of special interest. AEs of liver test elevation are clarified.</p> <p>Category 2 results of secondary or tertiary screening endometrial biopsy diagnosis are added to the list of reasons for subject discontinuation.</p>
01 July 2020	<p>The exploratory endpoint of "Mean score on the PGI-C in VMS from baseline to each visit" is re-categorized as a secondary endpoint.</p> <p>Language is added to instruct sites about daily diary compliance.</p>

Notes:

## Interruptions (globally)

Were there any global interruptions to the trial? No

## Limitations and caveats

None reported
