

Clinical trial results:

Astagraf XL® to Understand the Impact of Immunosuppression on De Novo DSA Development and Chronic Immune Activation in Kidney Transplantation

Summary

EudraCT number	2018-003867-79
Trial protocol	Outside EU/EEA
Global end of trial date	14 June 2019

Results information

Result version number	v1 (current)
This version publication date	28 June 2020
First version publication date	28 June 2020

Trial information

Trial identification

Sponsor protocol code	IDTX-MA-3004

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	14 June 2019
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	14 June 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study was to compare the incidence of a 2-part composite endpoint consisting of de novo DSA (dnDSA) formation or a designation of immune activation (IA) on peripheral blood molecular profiling in patients maintained on twice daily (BID) tacrolimus versus those maintained on Astagraf XL in the first year post-transplant.

Protection of trial subjects:

This clinical study was written, conducted and reported in accordance with the protocol, International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use (ICH) Good Clinical Practice (GCP) Guidelines, and applicable local regulations, including the European Directive 2001/20/EC, on the protection of human rights, and with the ethical principles that have their origin in the Declaration of Helsinki. Astellas ensures that the use and disclosure of protected health information (PHI) obtained during a research study complies with the federal, national and/or regional legislation related to the privacy and protection of personal information.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	09 September 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United States: 599
Worldwide total number of subjects	599
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	571
From 65 to 84 years	28
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Participants of ≥ 16 years and ≤ 70 of age requiring kidney transplant were enrolled. Randomization was stratified by alemtuzumab (yes/no), kidney donor profile index (KDPI) (3 levels: N/A [living donors] versus ≤ 50 versus > 50), and human leukocyte antigens (HLA) Class II mismatch (yes/no).

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Tacrolimus, Extended Release (Astagraf XL®) Once Daily

Arm description:

Participants received tacrolimus extended release capsule (Astagraf XL) at a starting dose of 0.15 milligram per kilogram (mg/kg), once daily, orally within 48 hours of transplantation (per the treating physician's discretion) for up to 1 year. Dose adjustments were allowed such that participants receiving tacrolimus maintained a minimal trough concentration of 6 nanogram per milliliter (ng/mL) at all times during the study.

Arm type	Active comparator
Investigational medicinal product name	Tacrolimus, Extended Release
Investigational medicinal product code	
Other name	Astagraf XL
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Participants received tacrolimus extended release (Astagraf XL) at a starting dose of 0.15 mg/kg, once daily, orally within 48 hours of transplantation (per the treating physician's discretion) for up to 1 year. Dose adjustments were allowed such that participants receiving tacrolimus maintained a minimal trough concentration of 6 ng/mL at all times during the study.

Arm title	Tacrolimus, Immediate Release Twice Daily (BID)
------------------	---

Arm description:

Participants received tacrolimus immediate release capsule as per the institutionally-derived protocol, BID, orally within 48 hours of transplantation (per the treating physician's discretion) for up to 1 year. Dose adjustments were allowed such that participants receiving tacrolimus maintained a minimal trough concentration of 6 ng/mL at all times during the study.

Arm type	Active comparator
Investigational medicinal product name	Tacrolimus, Immediate Release
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Participants received tacrolimus immediate release as per the institutionally-derived protocol, BID, orally within 48 hours of transplantation (per the treating physician's discretion) for up to 1 year. Dose adjustments were allowed such that participants receiving tacrolimus maintained a minimal trough concentration of 6 ng/mL at all times during the study.

Number of subjects in period 1	Tacrolimus, Extended Release (Astagraf XL®) Once Daily	Tacrolimus, Immediate Release Twice Daily (BID)
Started	300	299
Completed	204	198
Not completed	96	101
Adverse event, serious fatal	2	2
Consent withdrawn by subject	4	8
Randomized but Never Received Study Drug	12	12
Adverse event, non-fatal	48	40
Miscellaneous	5	6
Lost to follow-up	1	7
Lack of efficacy	4	3
Protocol deviation	20	23

Dose adjustments were allowed such that participants receiving tacrolimus maintained a minimal trough concentration of 6 ng/mL at all times during the study.	

Primary: Percentage of Participants who were Positive for de novo DSA (dnDSA) or Immune Activation (IA) Occurrence

End point title	Percentage of Participants who were Positive for de novo DSA (dnDSA) or Immune Activation (IA) Occurrence
End point description: DSA was considered as a categorical (binary) variable with positivity determined at a threshold criteria approaching mean fluorescence intensity (MFI)=1000 at any time during the study. IA was considered either present or absent using the Trugraf™ v2.0 molecular assay. A negative designation (Trugraf TX Normal) was referred to as Immune Quiescence (IQ). Due to operating characteristics of the assay, a positive designation was considered evidence of IA in all participants. The Modified Full Analysis Set (mFAS) consisted of all participants who were randomized and who received at least 1 dose of study drug (Astagraf XL or BID tacrolimus), and whose pretransplant cross-matched antibody samples did not demonstrate preformed DSA for the duration of the study.	
End point type	Primary
End point timeframe: From date of transplant until 1 year	

End point values	Tacrolimus, Extended Release (Astagraf XL®) Once Daily	Tacrolimus, Immediate Release Twice Daily (BID)		
Subject group type	Reporting group	Reporting group

Units: percentage of participants				
number (not applicable)				
percentage of participants	35.6	34.4		

Statistical analyses

Statistical analysis title	Statistical analysis 1
Statistical analysis description:	
Logistic regression with DSA/IA occurrence by Month 12 as response, with treatment group, planned Campath use, KDPI level (as recorded in IVRS), HLA Class II mismatch, recipient age, recipient gender, recipient race, and pre-transplant calculated panel reactivity antibody (cPRA) as fixed effects, and pooled site as a random effect with standard variance components covariance type.	
Comparison groups	Tacrolimus, Extended Release (Astagraf XL®) Once Daily v Tacrolimus, Immediate Release Twice Daily (BID)
Number of subjects included in analysis	554
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.5777
Method	Regression, Logistic
Parameter estimate	Odds ratio (OR)
Point estimate	1.115
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.76
upper limit	1.636

Secondary: Percentage of Participants who were Positive, Negative or Indeterminate for dnDSA Occurrence

End point title	Percentage of Participants who were Positive, Negative or Indeterminate for dnDSA Occurrence
End point description:	
DSA was considered as a categorical (binary) variable with positivity determined at a threshold criteria approaching MFI=1000 at any time during the study. Indeterminate was defined as MFI signal was >1000 and DSA was suspected, but could not be confirmed due to inadequate donor typing. Participants whose samples for the test were not available were reported as unknown. The mFAS consisted of all participants who were randomized and who received at least 1 dose of study drug (Astagraf XL or BID tacrolimus), and whose pretransplant cross-matched antibody samples did not demonstrate preformed DSA for the duration of the study.

Secondary: Percentage of Participants with Tubular Atrophy (ct) Biopsy Score Assessed Using Banff Lesion Scores

End point title	Percentage of Participants with Tubular Atrophy (ct) Biopsy Score Assessed Using Banff Lesion Scores
End point description:	
Central pathology reading was performed as per the 2007 Update to the Banff '97 classification. Banff Lesion Scores assess the presence and the degree of histopathological changes in the different compartments of renal transplant biopsies, focusing primarily but not exclusively on the diagnostic features seen in rejection. [Roufosse C et. al 2018]. Here, Score 0= No tubular atrophy, Score 1= Tubular atrophy involving up to 25% of the area of cortical tubules, Score 2= Tubular atrophy involving 26 to 50% of the area of cortical tubules and Score 3= Tubular atrophy involving in >50% of the area of cortical tubules. The BAS consisted of all mFAS participants who had at least 1 post-transplant central pathology assessment.

End point timeframe:

From first dose of study drug up to 7 days after last dose of study drug (up to 2 years)

End point values	Tacrolimus, Extended Release (Astagraf XL®) Once Daily	Tacrolimus, Immediate Release Twice Daily (BID)		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	288	287		
Units: percentage of participants				
number (not applicable)				
TEAEs	99.7	98.6		
TEAEs related to study treatment	77.8	70.7		
TESAEs	56.6	47.4		

TESAEs related to study treatment	27.4	23.7		
TEAEs causing discontinuation of study treatment	16.3	13.9		
TEAEs leading to death	0.7	0.7		

Statistical analyses

No statistical analyses for this end point

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From first dose of study drug up to 7 days after last dose of study drug (up to 2 years)

Adverse event reporting additional description:

The SAF consisted of all participants who enrolled into the study and took at least 1 dose of study medication and was used for all safety, tolerability, and medication compliance related variables.

Assessment type	Systematic
-----------------	------------

Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	20.1
--------------------	------

Reporting groups

Reporting group title	Tacrolimus, Immediate Release Twice Daily (BID)
-----------------------	---

Reporting group description:

Participants received tacrolimus immediate release capsule as per the institutionally-derived protocol, BID, orally within 48 hours of transplantation (per the treating physician's discretion) for up to 1 year. Dose adjustments were allowed such that participants receiving tacrolimus maintained a minimal trough concentration of 6 ng/mL at all times during the study.

Reporting group title	Tacrolimus, Extended Release (Astagraf XL®) Once Daily
-----------------------	--

Reporting group description:

Participants received tacrolimus extended release capsule (Astagraf XL) at a starting dose of 0.15 milligram per kilogram (mg/kg), once daily, orally within 48 hours of transplantation (per the treating physician's discretion) for up to 1 year. Dose adjustments were allowed such that participants receiving tacrolimus maintained a minimal trough concentration of 6 nanogram per millilitre (ng/mL) at all times during the study.

Serious adverse events	Tacrolimus, Immediate Release Twice Daily (BID)	Tacrolimus, Extended Release (Astagraf XL®) Once Daily

occurrences (all)	35	38

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 October 2017	The changes included: 1) The objectives involving results from kidney biopsies were modified. The first secondary objective was changed to an exploratory objective. An additional exploratory objective was added to compare outcomes at centers that routinely performed maintenance biopsies with those that did not. 2) An exploratory objective was changed to the first secondary objective. 3) The sub-categories for the molecular profiling endpoints were revised. To accommodate these changes, additional creatinine measurements were recorded to distinguish between clinical acute rejection and subacute rejection, the recording of additional creatinine results (from SOC testing) was also added. 4) The planned number of centers was increased from 25 to 30. 5) The upper age limit for study eligibility was increased from 65 to 70 years. 6) Study-specific instructions for nonoral administration of tacrolimus were added. 7) The inclusion criterion requiring the most recent pretransplant calculated panel reactive antibody (cPRA) $\leq 50\%$ was removed. 8) The exclusion criteria regarding crossmatches and anti-HLA antibody testing results (exclusion criteria 11 to 13) were reorganized for clarity. 9) Undergoing a second organ transplant was added as a discontinuation criterion. 10) After 6 weeks posttransplant had elapsed, removal of a minimum tacrolimus trough concentration requirement from the discontinuation criteria. 11) The FAS was modified to include all randomized subjects who receive at least one dose of study drug. An additional analysis set, the mFAS, was designated as the primary analysis set for efficacy assessments. This set is defined as including all randomized subjects who: 1) receive at least one dose of study drug and 2) are not deemed by the adjudication board to have pre-formed DSA.
06 October 2017	The changes included: 12) For the study visits between Day 90 and Day 365 only, all available outpatient tacrolimus concentration assessments done per standard of care and available in the centralized medical records will be recorded. 13) For subjects who develop clinically significant BK viremia (as assessed per standard of care) during study participation, the peak viremia level obtained per standard of care will be retrospectively recorded in the eCRF at the time of the subject's discontinuation or completion. 14) The scope of the MFI Adjudication Board broadened.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
