

Clinical trial results:

A double blind, randomised, placebo-controlled trial to evaluate the dose-exposure and safety of nintedanib per os on top of standard of care for 24 weeks, followed by open label treatment with nintedanib of variable duration, in children and adolescents (6 to 17 year-old) with clinically significant fibrosing Interstitial Lung Disease

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-001006-PIP05-18
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	15 June 2022
Is this the analysis of the primary completion data?	Yes
Primary completion date	24 May 2022
Global end of trial reached?	Yes
Global end of trial date	24 May 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main objective of the study is to evaluate dose-exposure and safety of nintedanib in children and adolescents with fibrosing Interstitial Lung Disease (ILD).

Protection of trial subjects:

Only subjects that met all the study inclusion and none of the exclusion criteria were to be entered in the study. All subjects were free to withdraw from the clinical trial at any time for any reason given. Close monitoring of all subjects was adhered to throughout the trial conduct. Treatment interruption and dose reduction were allowed as medically indicated.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	27 February 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Subject disposition

Recruitment

Recruitment details:

This was a multicenter, multinational clinical trial in children and adolescents (6 to 17 years old) with clinically significant fibrosing Interstitial Lung Disease (ILD) in two parts. A randomised, placebo-controlled, double-blind period (DBP) of 24 weeks was followed by an open-label Nintedanib period (OLNP) of variable duration.

Pre-assignment

Screening details:

Only subjects that met all inclusion and none exclusion criteria could enter the study. Subjects were free to withdraw at any time for any reason given. Subjects were monitored throughout the trial conduct. Treatment interruption and dose reduction were allowed as medically indicated.

Period 1

Period 1 title	Double-blind period (DBP)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer

Blinding implementation details:

Subjects, investigators and any other site personnel remained blinded with regard to the randomised treatment assignments until after the final database lock.

Arms

Are arms mutually exclusive?	Yes
Arm title	DBP+OLNP: Randomised to placebo

Arm description:

This arm shows placebo randomised subjects treated orally with a Nintedanib matching placebo soft capsule twice daily (DBP).

Subjects who continued with the open-label Nintedanib period (OLNP) after the DBP switched to active Nintedanib treatment and were treated orally with Nintedanib twice daily (OLNP).

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. The dosing interval was approximately 12 hours from one dose to the next dose in the DBP and OLNP.

In this arm subjects received placebo first (DBP), then Nintedanib (OLNP).

DBP: Planned was from 1st randomised trial to last blinded drug intake. OLNP: Planned was from 1st open-label to last open-label Nintedanib intake.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. The dose interval was approximately 12 hours from one to the next dose.

Arm title	DBP+OLNP: Randomised to Nintedanib
------------------	------------------------------------

Arm description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib in the DBP and OLNP twice daily.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. The dosing interval was approximately 12 hours from one dose to the next dose in the DBP and OLNP.

In this arm subjects received Nintedanib only (DBP+OLNP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake. OLNP: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Arm type	Experimental
Investigational medicinal product name	Nintedanib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. The dose interval was approximately 12 hours from one to the next dose.

Number of subjects in period 1	DBP+OLNP: Randomised to placebo	DBP+OLNP: Randomised to Nintedanib
Started	13	26
Completed	11	21
Not completed	2	5
Discontinued treatment due to adverse event	-	2
Completed prematurely due to administrative EoT	2	2
Discontinued treatment due to other reason	-	1

Period 2

Period 2 title	Open-label Nintedanib period (OLNP)
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

No blinding in the OLNP

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	DBP+OLNP: Randomised to placebo
------------------	---------------------------------

Arm description:

This arm shows placebo randomised subjects treated orally with a Nintedanib matching placebo soft capsule twice daily (DBP).

Subjects who continued with the open-label Nintedanib period (OLNP) after the DBP switched to active Nintedanib treatment and were treated orally with Nintedanib twice daily (OLNP).

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. The dosing interval was approximately 12 hours from one dose to the next dose in the DBP and OLNP.

In this arm subjects received placebo first (DBP), then Nintedanib (OLNP).

DBP: Planned was from 1st randomised trial to last blinded drug intake. OLNP: Planned was from 1st open-label to last open-label Nintedanib intake.

Arm type	Placebo
Investigational medicinal product name	Nintedanib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Medication dosage was per administration 50 milligram (mg) [2 capsules with strength 25 mg], 75 mg [3 capsules with strength 25 mg], 100 mg [1 capsule with strength 100 mg or 4 capsules with strength 25 mg] or 150 mg [1 capsule with strength 150 mg or 6 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. The dose interval was approximately 12 hours from one to the next dose.

Arm title	DBP+OLNP: Randomised to Nintedanib
------------------	------------------------------------

Arm description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib in the DBP and OLNP twice daily.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. The dosing interval was approximately 12 hours from one dose to the next dose in the DBP and OLNP.

In this arm subjects received Nintedanib only (DBP+OLNP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake. OLNP: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Arm type	Experimental
Investigational medicinal product name	Nintedanib

Subject analysis set title	DBP+OLNP: 6 to < 12 years - exposed to Nintedanib
Subject analysis set type	Per protocol

Subject analysis set description:

This arm shows subjects aged 6 to < 12 years old who were exposed to Nintedanib only, either randomised placebo (treated with Nintedanib in the OLNP only) and randomised Nintedanib (treated with Nintedanib in both, DBP and OLNP). The 6 to < 12 years old subjects were treated orally with Nintedanib twice daily with a dose interval of approximately 12 hours from one dose to the next dose.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received Nintedanib only (OLNP or DBP+OLNP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake. OLNP: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Subject analysis set title	DBP+OLNP: 12 to < 18 years - exposed to Nintedanib
Subject analysis set type	Per protocol

Subject analysis set description:

This arm shows subjects aged 12 to < 18 years old who were exposed to Nintedanib only either randomised placebo (treated with Nintedanib in the OLNP only) and randomised Nintedanib (treated with Nintedanib in both, DBP and OLNP). The 12 to 18 years old subjects were treated orally with Nintedanib twice daily with a dose interval of approximately 12 hours from one dose to the next dose.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received Nintedanib only (OLNP or DBP+OLNP). DBP: Planned was from first randomised trial drug intake to last blinded drug intake. OLNP: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Subject analysis set title	DBP: Randomised to placebo
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subjects treated orally with a Nintedanib matching placebo soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to Nintedanib
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib in the DBP twice daily with a dose interval of approximately 12 hours from one dose to the next dose.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received Nintedanib only (DBP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	OLNP: Randomised to placebo and switched to Nintedanib
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows subjects who continued with the open-label Nintedanib period (OLNP) after the DBP, switched to active Nintedanib treatment in the OLN and were treated orally with Nintedanib twice daily with a dose interval of approximately 12 hours from one dose to the next dose.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received placebo first (DBP) and then Nintedanib (OLNP). DBP: Planned was from first randomised trial drug intake to last blinded drug intake. OLN: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Subject analysis set title	DBP+OLNP: Randomised to placebo
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows subjects who continued with the open-label Nintedanib period (OLNP) after the DBP, switched to active Nintedanib treatment in the OLN and were treated orally with Nintedanib twice daily with a dose interval of approximately 12 hours from one dose to the next dose.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received placebo first (DBP) and then Nintedanib (OLNP). DBP: Planned was from first randomised trial drug intake to last blinded drug intake. OLN: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Subject analysis set title	DBP + OLN: Randomised to Nintedanib
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib in the DBP and OLN twice daily with a dose interval of approximately 12 hours from one dose to the next dose.

Medication dosage was per administration 50 milligram (mg) [2x25 mg capsules (cap)], 75 mg [3x25 mg cap], 100 mg [1x100 mg cap or 4x25 mg cap] or 150 mg [1x150 mg cap or 6x25 mg cap] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received Nintedanib in both periods (DBP + OLN). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

OLN: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Subject analysis set title	DBP: Randomised to placebo - capsule size of 25 mg capsule
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subjects treated orally with placebo soft capsules of 25 milligram (mg) with a capsule size of 5 millimeter (mm) diameter and 8 mm length, oval shaped, twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage per administration was 50 milligram (mg) [2 capsules with strength 25 mg], 75 mg [3 capsules with strength 25 mg], 100 mg [4 capsules with strength 25 mg] or 150 mg [6 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to Nintedanib - capsule size of 25 mg capsule
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib soft capsules of 25 milligram (mg) with a capsule size of 5 millimeter (mm) diameter and 8 mm length, oval shaped, twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind

period (DBP).

Medication dosage per administration was 50 milligram (mg) [2 capsules with strength 25 mg], 75 mg [3 capsules with strength 25 mg], 100 mg [4 capsules with strength 25 mg] or 150 mg [6 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received Nintedanib only (DBP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to placebo - capsule size of 100 mg capsule
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subjects treated orally with placebo soft capsules of 100 mg with a capsule size of 6 mm diameter and 16 mm length, oblong shaped, twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage per administration was 100 mg [1 capsules with strength 100 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to Nintedanib - capsule size of 100 mg capsule
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib soft capsules of 100 mg with a capsule size of 6 mm diameter and 16 mm length, oblong shaped, twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage per administration was 100 mg [1 capsules with strength 100 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received Nintedanib only (DBP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to placebo - capsule size of 150 mg capsule
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subject treated orally with placebo soft capsules of 150 mg with a capsule size of 7 mm diameter and 18 mm length, oblong shaped, twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage per administration was 150 mg [1 capsules with strength 150 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to Nintedanib - capsule size of 150 mg capsule
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib soft capsules of 150 mg with a capsule size of 7 mm diameter and 18 mm length, oblong shaped, twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage per administration was 150 mg [1 capsules with strength 150 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received Nintedanib only (DBP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to placebo - 2 capsules
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subjects treated orally with 1 Nintedanib matching placebo soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 100 mg [1 capsule with strength 100 mg] or 150 mg [1 capsule with strength 150 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to Nintedanib - 2 capsules
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with 1 Nintedanib soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 100 mg [1 capsule with strength 100 mg] or 150 mg [1 capsule with strength 150 mg] based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received Nintedanib only (DBP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to placebo - 4 capsules
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subjects treated orally with 2 Nintedanib matching placebo soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 50 milligram (mg) [2 capsules with strength 25 mg], based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to Nintedanib - 4 capsules
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with 2 Nintedanib soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 50 milligram (mg) [2 capsules with strength 25 mg], based on the subject's weight at baseline (= 0 weeks).

In this arm subjects received Nintedanib only (DBP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to placebo - 6 capsules
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subjects treated orally with 3 Nintedanib matching placebo soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 75 mg [3 capsules with strength 25 mg] based on the

subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to Nintedanib - 6 capsules
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows Nintedanib randomised subjects treated orally with 3 Nintedanib soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 75 mg [3 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received Nintedanib only (DBP). Subjects in this arm do not entail subjects from the 'randomised to placebo' arm.

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Subject analysis set title	DBP: Randomised to placebo - >6 capsules
Subject analysis set type	Intention-to-treat

Subject analysis set description:

This arm shows placebo randomised subjects treated orally with >3 Nintedanib matching placebo soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP).

Medication dosage was per administration 100 mg [4 capsules with strength 25 mg] or 150 mg [6 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed.

In this arm subjects received placebo only (DBP).

DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Primary: Area under the plasma concentration-time curve at steady state (AUC_{T,ss}) based on sampling at steady state (at Week 2 and Week 26)

End point title	Area under the plasma concentration-time curve at steady state (AUC _{T,ss}) based on sampling at steady state (at Week 2 and Week 26) ^[1]
-----------------	--

End point description:

Area under the plasma concentration-time curve at steady state (AUC_{T,ss}) based on sampling at steady state (at Week 2 and Week 26) after multiple oral administration of Nintedanib by age group over all treatments.

Values of samples taken at Week 2 (for randomised Nintedanib subjects) and at Week 26 (for randomised placebo subjects) were used. Missing values at Week 2 of randomised Nintedanib subjects were replaced with values taken at Week 26.

Pharmacokinetic parameter analysis set (PKS): This set includes all subjects in the treated set (TS) who provide at least one pharmacokinetic (PK) endpoint that was not excluded due to a protocol deviation relevant to the evaluation of PK or due to PK non-evaluability.

End point type	Primary
----------------	---------

End point timeframe:

At Week 2 and at Week 26: at 5 minutes before and at 0, 1, 2, 3, 4, 6, and 8 hours post administration of the morning dose

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: This endpoint was evaluated only descriptively. Thus, no statistical hypothesis were tested.

End point values	DBP+OLNP: 6 to < 12 years - exposed to Nintedanib	DBP+OLNP: 12 to < 18 years - exposed to Nintedanib

Secondary: Absolute change from baseline in leg length at Week 52 - left

End point title	Absolute change from baseline in leg length at Week 52 - left
-----------------	---

End point description:

Absolute change from baseline in left leg length at Week 52 was assessed by measuring distance between anterior iliac spine and medial malleolus 3 times at each leg and each time point. The average of these 3 measurements was taken per time point.

Absolute change from baseline in left leg length at Week 52 in the treated set (TS) was based on a Mixed Model Repeated Measures (MMRM), with fixed categorical effects of (randomised) treatment at each visit, age–group and the fixed continuous effects of baseline at each visit, and random effect for subject. Visit was treated as the repeated measure with an unstructured covariance structure used to model the within–subject measurements.

Treated set (TS): The TS consisted of participants who were randomised to a treatment group and received at least one dose of study medication. Only participants with correctly measured baseline and at least one post-baseline measurement were included in the analysis.

End point type	Secondary
----------------	-----------

End point timeframe:

MMRM included measurements at 0, 12, 24, 36, 52, 64, and 76 weeks after first drug administration. MMRM values at Week 52 are reported in the table below

End point title	Absolute change from baseline in 6 minutes (min) walk distance at Week 24
-----------------	---

End point description:

Absolute change from baseline in 6 minutes (min) walk distance at Week 24 in the treated set(TS) was based on a Mixed Model Repeated Measures (MMRM), with fixed categorical effects of (randomised) treatment at each visit, age–group and the fixed continuous effects of baseline at each visit, and random effect for subject. Visit was treated as the repeated measure with an unstructured covariance structure used to model the within–subject measurements.

Treated set (TS): The TS consisted of participants who were randomised to a treatment group and received at least one dose of study medication. Only participants with correctly measured baseline and at least one post-baseline measurement were included in the analysis.

End point type	Secondary
----------------	-----------

End point timeframe:

MMRM included measurements at 0, 24, and 52 weeks after first drug administration. MMRM values at Week 24 are reported in the table below

Secondary: Subjects acceptability based on the size of capsules at Week 24 - patient question

End point title	Subjects acceptability based on the size of capsules at Week 24 - patient question
-----------------	--

End point description:

Acceptability is the overall ability and willingness of subjects to use medicinal products as intended. Acceptability based on capsule size was assessed by an acceptability questionnaire (1 item and 3 categories) for subjects. In case the subject was considered not old enough as per investigator judgment the caregiver could assist with completion. Additionally to the commercially available 100 milligram (mg) soft capsules (oblong shape, 6 millimeter (mm) diameter, 16 mm length) and 150 mg soft capsules (oblong shape, 7 mm diameter, 18 mm length), 25 mg Nintedanib soft capsules of smaller size (oval shape, 5 mm diameter, 8 mm length) were provided for subjects who were assigned to a dose smaller than 100 mg or were unable to swallow the larger 100 mg or 150 mg capsules.

Treated set (TS): The TS consisted of subjects who were randomised to a treatment group and received at least one dose of study medication. Only subjects with non-missing results were included in the analysis.

End point type	Secondary

Reporting groups

Reporting group title	OLNP: Randomised to placebo and switched to Nintedanib
-----------------------	--

Reporting group description:

This arm shows subjects who continued with the open-label Nintedanib period (OLNP) after the DBP, switched to active Nintedanib treatment in the OLN and were treated orally with Nintedanib twice daily with a dose interval of approximately 12 hours from one dose to the next dose. Medication dosage was per administration 50 milligram (mg) [2 capsules with strength 25 mg], 75 mg [3 capsules with strength 25 mg], 100 mg [1 capsule with strength 100 mg or 4 capsules with strength 25 mg] or 150 mg [1 capsule with strength 150 mg or 6 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. In this arm subjects received Nintedanib only (OLNP). OLN: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

Reporting group title	DBP: Randomised to placebo
-----------------------	----------------------------

Reporting group description:

This arm shows placebo randomised subjects treated orally with a Nintedanib matching placebo soft capsule twice daily with a dose interval of approximately 12 hours from one dose to the next dose in the double-blind period (DBP). Medication dosage was per administration 50 milligram (mg) [2 capsules with strength 25 mg], 75 mg [3 capsules with strength 25 mg], 100 mg [1 capsule with strength 100 mg or 4 capsules with strength 25 mg] or 150 mg [1 capsule with strength 150 mg or 6 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. In this arm subjects received placebo only (DBP). DBP: Planned was from first randomised trial drug intake to last blinded drug intake.

Reporting group title	DBP+OLNP: Randomised Nintedanib (Nintedanib exposure period)
-----------------------	--

Reporting group description:

This arm shows Nintedanib randomised subjects treated orally with Nintedanib in the DBP and OLN twice daily with a dose interval of approximately 12 hours from one dose to the next dose. Medication dosage was per administration 50 milligram (mg) [2 capsules with strength 25 mg], 75 mg [3 capsules with strength 25 mg], 100 mg [1 capsule with strength 100 mg or 4 capsules with strength 25 mg] or 150 mg [1 capsule with strength 150 mg or 6 capsules with strength 25 mg] based on the subject's weight at baseline (= 0 weeks). The dosage was adjusted at subsequent visits if the subject's weight had changed. In this arm subjects received Nintedanib in both periods (DBP + OLN). Subjects in this arm do not entail subjects from the 'randomised to placebo' arms. DBP: Planned was from first randomised trial drug intake to last blinded drug intake. OLN: Planned was from first open-label Nintedanib intake to last open-label Nintedanib intake.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
19 June 2020	<p>This amendment was implemented after the first patient was enrolled into the trial. The following main changes were introduced:</p> <ul style="list-style-type: none">•The unblinding of selected non-trial personnel from the sponsor involved in the PK analysis was further specified based on the Food and Drug Administration (FDA) recommendation to conduct an interim PK evaluation at Week 2 post-dose to ensure that the systemic exposure of nintedanib with the proposed weight-based dosing regimen in patients of 6 to 17 years of age is comparable with adults.•It was clarified that SMC members were independent from the trial team and that the SMC reviewed PK data in addition to safety data. Furthermore, the actions expected from the SMC to mitigate the risk in the trial were specified in more detail.•Based on an FDA recommendation, restrictions regarding concomitant use of potent Pgp and CYP3A4 inhibitors and inducers were added to minimise potential impact of these co-medications on the primary PK endpoint.•Exclusion criterion No. 13 was modified to exclude patients with documented allergy to soya to align with the contraindications reported in the Investigator's Brochure.•Results from the trial in adults with PF-ILD were added, as they had become available. It was clarified that if PK data for the primary analysis were not sufficient at the time of DBL1, further PK data were to be collected.•It was specified that conduct of MRI/x-ray, dental examination, and dental imaging was to only be done in patients who qualified for randomisation in order to avoid unnecessary procedures.
14 June 2021	<p>Following main changes were introduced by this amendment:</p> <ul style="list-style-type: none">•First dose of open-label trial medication of Part B (Visit 6) was administered at trial site to ensure monitoring of immediate adverse reactions to those patients who had received placebo during Part A and received their first dose of active medication at Visit 6.•Clarified laboratory tests with clinically relevant changes at EoT were repeated.•Follow-up Visit time window was reduced from 7 to 3 days.•PK sampling was repeated if blood samples were not taken at required time point, wrong medication was taken, a sample was destroyed/lost during shipment to obtain all required samples for PK analyses, if possible.•Information about reported adverse reactions and risks specific for paediatric population was added.•Mitigation measures to address additional risks due to COVID-19 pandemic were added. If site access was restricted, some activities on site such as on-site source data review and source data verification was performed remotely or replaced by centralised monitoring. No restrictions for trial participants to receive COVID-19 vaccination.•PK sampling in 10 children aged 6 to 11 years was completed at DBL1, if feasible.•If further PK data were needed at DBL1 snapshot was taken once further PK data had been collected and data based on DBL1 snapshot was updated and trial team was informed about number of patients with evaluable PK missing to reach target.•Specified procedures if patient's weight decrease below 13.5 kg.•Pathological findings in bone imaging and stunted growth in dental imaging were added to list of AESIs•Instructions on treatment interruption and resumption of treatment.•Primary PK analysis was calculated by non-compartmental and compartmental analysis. Clarified Investigational Medicinal Product (IMP) interruption was at most 4 weeks, while re-escalation to dose assigned could occur any time per investigator judgement.•SMC was to have no contact with central readers.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
17 March 2020	Subject recruitment and trial site initiation were paused due to the Covid-19 pandemic.	04 June 2020

Notes:

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The end of trial (EoT) was planned in the protocol once 30 subjects had completed pharmacokinetic sampling at Week 26 or prematurely discontinued the trial.

At EoT no subject had reached Week 100 yet. The trial was completed as per protocol.

Notes:
