

Clinical trial results:

A multicentre Phase IIb trial to evaluate the efficacy and tolerability of ModraDoc006/r in subjects with metastatic Castration Resistant Prostate Cancer (mCRPC), suitable for treatment with a taxane.

Summary

EudraCT number	2019-000582-21
Trial protocol	DE CZ HU
Global end of trial date	29 November 2021

Results information

Result version number	v1 (current)
This version publication date	20 October 2022
First version publication date	20 October 2022

Trial information

Trial identification

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 March 2022
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	29 November 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To determine the efficacy of ModraDoc006/r, as measured by radiographic Progression-Free Survival (rPFS), compared to standard treatment with i.v. docetaxel in patients with mCRPC.

Protection of trial subjects:

To minimize the risk to patients and maximize safety, the following factors were incorporated into the trial design:

- Detailed safety and laboratory assessments were performed.
- Patients were provided with diet and hydration instructions and a home prescription for loperamide, with instructions on how to use this medication in case diarrhea occurred at home
- All clinical observations were evaluated by the Investigator on an ongoing basis.
- The trial was planned to minimize the time interval which would influence routine procedure to the patient
- As anti-emetic therapy, all patients were given bi-daily a 5HT3 antagonist (1 mg of granisetron 1 hour -, or 8 mg of ondansetron 2 hours -) prior to oral ModraDoc006/r administration during the first two weeks. In subsequent cycles, 5HT3 antagonist premedication may have been given if indicated. All patients were provided with a home prescription for anti-emetics (metoclopramide 10 mg maximum 4 times daily) and instructions on its use in case nausea/vomiting occurred at home. If metoclopramide (or domperidone) proved insufficient, a 5HT3 antagonist may have been taken on study treatment days, and these could continue for up to 3 days after the intake of study treatment. If these medications proved insufficient, dexamethasone and lorazepam were allowed to be added as anti-emetic treatment. Dexamethasone was to be taken at a low dose of 1 mg, because if used concomitantly with ritonavir could have led to increased exposure to dexamethasone. If vomiting occurred after intake, the patient was instructed not to take any new study drug.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	08 May 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 8
Country: Number of subjects enrolled	Czechia: 5
Country: Number of subjects enrolled	Germany: 5
Country: Number of subjects enrolled	Hungary: 12
Country: Number of subjects enrolled	Russian Federation: 46
Country: Number of subjects enrolled	United States: 27
Worldwide total number of subjects	103
EEA total number of subjects	30

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	21
From 65 to 84 years	82
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details: -

Pre-assignment period milestones

Number of subjects started	135 ^[1]
----------------------------	--------------------

Number of subjects completed	103
------------------------------	-----

Pre-assignment subject non-completion reasons

Reason: Number of subjects	did not meet inclusion criteria: 32
----------------------------	-------------------------------------

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline characteristics have only been provided for the evaluable patients (Full Analysis Set).

Reasons for exclusion from the FAS analysis were:

- 2 patients not treated
- 9 patients excluded due to both evaluations missing (post-baseline RECIST and postbaseline bone scan)

Period 1

Period 1 title	Screening and Randomisation
----------------	-----------------------------

Is this the baseline period?	No
------------------------------	----

Allocation method	Randomised - controlled
-------------------	-------------------------

Blinding used	Not blinded
---------------	-------------

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Cohort 1: IV docetaxel
-----------	------------------------

Arm description:

Treatment with docetaxel 75 mg/m² administered intravenous every 3 weeks

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Docetaxel
--	-----------

Investigational medicinal product code	
--	--

Other name	
------------	--

Pharmaceutical forms	Concentrate for solution for infusion
----------------------	---------------------------------------

Routes of administration	Infusion
--------------------------	----------

Dosage and administration details:

Patients received docetaxel 75 mg/m² infused intravenous over 1 hour on Day 1 every 21 days (every 3 weeks) plus prednisone 5 mg orally, twice daily. Premedication with dexamethasone was required.

Arm title	Cohort 2: ModraDoc006/r
-----------	-------------------------

Arm description:

Treatment with ModraDoc006/r administered orally, bi-daily once weekly (BIDW)

Arm type	Experimental
----------	--------------

Investigational medicinal product name	ModraDoc006
--	-------------

Investigational medicinal product code	
--	--

Other name	
------------	--

Pharmaceutical forms	Tablet
----------------------	--------

Routes of administration	Oral use
--------------------------	----------

Dosage and administration details:

Patients initially received ModraDoc006 30 mg in combination with ritonavir 200 mg in the morning and ModraDoc006 20 mg in combination with 100 mg ritonavir in the afternoon (7 to 12 hours after the morning dose), on Days 1, 8, and 15 of a 21-day cycle, plus prednisone 5 mg orally, twice daily. After 39 randomized patients (21 in ModraDoc006/r arm), the morning dose was amended to 20 mg in combination with ritonavir 200 mg.

Investigational medicinal product name	ritonavir

No statistical analyses for this end point

Adverse events

Adverse events information

Timeframe for reporting adverse events:

The adverse events were monitored and collected from the time the patient gave informed consent and throughout the study until 30 days after the last ModraDoc006/r or intravenous docetaxel administration.

Adverse event reporting additional description:

Safety analysis population assessed for all adverse events

Assessment type	Systematic

Reporting groups

Reporting group title	Cohort 1: IV docetaxel
-----------------------	------------------------

Reporting group description:

Patients received docetaxel 75 mg/m² infused intravenous over 1 hour on Day 1 every 21 days (every 3 weeks plus prednisone 5 mg orally, twice daily. Premedication with dexamethasone was required.

Reporting group title	Cohort 2: ModraDoc006/r
-----------------------	-------------------------

Reporting group description:

Patients initially received ModraDoc006 30 mg in combination with ritonavir 200 mg in the morning and ModraDoc006 20 mg in combination with 100 mg ritonavir in the afternoon (7 to 12 hours after the morning dose), on Days 1, 8, and 15 of a 21-day cycle (bi-daily once weekly dosing), plus prednisone 5 mg orally, twice daily. After 39 patients were enrolled, the morning dose was amended to ModraDoc006 20 mg in combination with ritonavir 200 mg.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
05 March 2019	Changes included clarifications on exclusion criteria, dose modifications, and administrative aspects
31 March 2020	<p>Initially the trial aimed to recruit a subset of patients with mCRPC eligible for treatment with docetaxel to test the feasibility of the ORR endpoint within a reasonable timeframe. As the proportion of mCRPC patients with measurable disease according to RECIST was low (order of 20-30%), the trial was set up with a relatively high number of clinical sites, to overcome the potential issue of slow recruitment. Nonetheless, it was a challenge to recruit the target patient population in a timely manner. Due to above feasibility concerns for this study, as well as a future phase III study, the study protocol was changed to allow the inclusion of a broader mCRPC patient population reflecting the reality that only few patients with prostate cancer have RECIST measurable disease. Consequently, the primary endpoint changed from ORR to rPFS.</p> <p>Adaption of the starting dose for Cohort 2 ModraDoc006 30-20mg to 20-20mg, both doses combined with ritonavir 200-100mg BIDW, to improve the profile of ModraDoc006/r as an effective, convenient and tolerable oral treatment.</p> <p>Harmonization of assessments for both arms, as the initial schedule of assessments induced potential AE reporting bias, due to additional weekly assessment time points during Cycle 1 and 2 for the ModraDoc006/r Cohort 2 only. In the limited number of patients treated initially, there was more extensive reporting of mostly mild Grade 1/2 AEs, in comparison with standard docetaxel i.v. Cohort 1. These reported AEs are common side effects for i.v. docetaxel as well. To correct for potential AE reporting bias, the assessment time points of ModraDoc006/r Cohort 2 were adapted and implemented for i.v. docetaxel Cohort 1 alike. Based on the expected lower number of AEs at the adjusted dose level, as well as the low overall level of severe toxicities demonstrated in the phase Ib study, it was considered safe to change to weekly safety assessments during Cycle 1 only.</p> <p>Widening of screening windows.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
