

Clinical trial results:

Immune responses to influenza and pneumococcal conjugate vaccines in older adults compared to middle-aged adults and adults.

Summary

EudraCT number	2019-000836-24
Trial protocol	NL
Global end of trial date	07 October 2024

Results information

Result version number	v1 (current)
This version publication date	29 October 2025
First version publication date	29 October 2025

Trial information

Trial identification

Sponsor protocol code	IIV-406

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Interim
Date of interim/final analysis	07 October 2025
Is this the analysis of the primary completion data?	Yes
Primary completion date	07 October 2024
Global end of trial reached?	Yes
Global end of trial date	07 October 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To get a better insight in the influence of age and age-related changes by internal and external factors on vaccine-induced immune responses and gain knowledge on the trajectory of immune decline in older adults, pre-elderly (middle-aged) adults in comparison to adults with the ultimate goal to formulate evidence-based strategies to improve immunity to vaccines in the ageing population.

Protection of trial subjects:

The vaccines used in this trial are registered vaccines which are used according to the indication. The participants are all eligible for the influenza and (booster) COVID-19 vaccinations. Only the pneumococcal vaccination will be given as an extra vaccination. However, this vaccine is registered in Europe and in the USA, and is used for several years in children and adults. Furthermore, the risk of sampling of blood via finger pricks and venipuncture, faeces and nasal mucosal fluid is considered low. Blood collection could result in a small bruise at the site of blood withdrawal, which will disappear within a few days. The amount of blood drawn per two months within the study is maximum 269 mL and is well within the standard that is maintained by Sanquin Bloodbank.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 July 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 326
Worldwide total number of subjects	326
EEA total number of subjects	326

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	160
From 65 to 84 years	140
85 years and over	26

Subject disposition

Recruitment

Recruitment details:

The older adults were recruited by the wetenschapsbureau of the Spaarne hospital from a previous Influenza-like illness (ILI) study sponsored by the RIVM. Middle-aged and adults subjects were health care workers or laboratory personnel in the Utrecht area recruited via email, flyers and posters.

Pre-assignment

Screening details:

Screening was performed during visit T0. During this visit, the following tasks were executed: checking of subject information was received and understood; questions were answered; Informed consent (IC) was obtained; An inclusion number was assigned and Inclusion and exclusion criteria were checked.

Period 1

Period 1 title	QIV and PCV13 vaccination
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	25-49 years of age, QIV + PCV13

Arm description:

25-49 years of age, QIV + PCV13

Arm type	Experimental
Investigational medicinal product name	Influvac Tetra
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Suspension for injection in pre-filled syringe
Routes of administration	Intramuscular use

Dosage and administration details:

One dose of 0,5 mL contains the following strains:

- A/Michigan/45/2015 (H1N1)pdm09-like strain (A/Singapore/GP1908/2015, IVR-180): 15 microgram HA
- A/Singapore/INFIMH-16-0019/2016 (H3N2)-like strain (A/Singapore/INFIMH-16-0019/2016,NIB-104): 15 microgram HA
- B/Colorado/06/2017-like strain (B/Maryland/15/2016,NYMC BX-69A): 15 microgram HA
- B/Phuket.3073.2013-like strain (B/Phuket/3073/2013, wild type) 15 microgram HA

Investigational medicinal product name	Prevanar 13
Investigational medicinal product code	
Other name	Pneumococcal polysaccharide conjugate vaccine (13-valent, adsorbed)
Pharmaceutical forms	Suspension for injection
Routes of administration	Intramuscular use

Dosage and administration details:

One dose (0,5 ml) contains:

- Pneumococcal polysaccharide serotype 1: 2,2 µg
- Pneumococcal polysaccharide serotype 3: 2,2 µg
- Pneumococcal polysaccharide serotype 4: 2,2 µg
- Pneumococcal polysaccharide serotype 5: 2,2 µg
- Pneumococcal polysaccharide serotype 6A: 2,2 µg
- Pneumococcal polysaccharide serotype 6B: 4,4 µg
- Pneumococcal polysaccharide serotype 7F: 2,2 µg
- Pneumococcal polysaccharide serotype 9V: 2,2 µg
- Pneumococcal polysaccharide serotype 14: 2,2 µg
- Pneumococcal polysaccharide serotype 18C: 2,2 µg

- Pneumococcal polysaccharide serotype 19A: 4,4 µg
- Pneumococcal polysaccharide serotype 19F: 2,2 µg
- Pneumococcal polysaccharide serotype 23F: 2,2 µg

All serotypes are conjugated to CRM197 carrier protein, adsorbed on aluminium phosphate
1 dos (0,5ml) contains approximately 32 µg CRM 197 carrier protein and 0,125 mg aluminium

Arm title	50-64 years of age, QIV + PCV13
Arm description: 50-64 years of age, QIV + PCV13	
Arm type	Experimental
Investigational medicinal product name	Influvac Tetra
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Suspension for injection in pre-filled syringe
Routes of administration	Intramuscular use

Dosage and administration details:

One dose of 0,5 mL contains the following strains:

- A/Michigan/45/2015 (H1N1)pdm09-like strain (A/Singapore/GP1908/2015, IVR-180): 15 microgram HA
- A/Singapore/INFIMH-16-0019/2016 (H3N2)-like strain (A/Singapore/INFIMH-16-0019/2016, NIB-104): 15 microgram HA
- B/Colorado/06/2017-like strain (B/Maryland/15/2016, NYMC BX-69A): 15 microgram HA
- B/Phuket.3073.2013-like strain (B/Phuket/3073/2013, wild type) 15 microgram HA

Investigational medicinal product name	Prevanar 13
Investigational medicinal product code	
Other name	Pneumococcal polysaccharide conjugate vaccine (13-valent, adsorbed)

Notes:

[1] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[2] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[3] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[4] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[5] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[6] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[7] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[8] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

Period 2

Period 2 title	COVID vaccination, primary series
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	50-64 years of age, Comirnaty (Pfizer/BioNTech)

Arm description:

50-64 years of age, Comirnaty (Pfizer/BioNTech)

Only 2 late inclusions at Tc, no subjects truly started at starting point. Starting point set at 2 instead of 0 due to technical limitations.

Arm type	Experimental
Investigational medicinal product name	Comirnaty
Investigational medicinal product code	
Other name	COVID-19 mRNA Vaccine, Pfizer–BioNTech COVID-19 vaccine
Pharmaceutical forms	Dispersion for injection
Routes of administration	Intramuscular use

Dosage and administration details:

The vaccine is in a multidose vial and must be diluted before use.

One dose (0,3mL) contains 30 micrograms of tozinameran, a COVID-19 mRNA Vaccine (embedded in lipid nanoparticles).

2 dosages were given with an interval of 28 days (+7days).

Arm title	65+ years of age, Comirnaty (Pfizer/BioNTech)
------------------	---

Arm description:

Arm description:

25-49 years of age, Spikevax (Moderna)

Arm type	Experimental
Investigational medicinal product name	Spikevax
Investigational medicinal product code	
Other name	COVID-19 mRNA vaccine, Moderna
Pharmaceutical forms	Dispersion for injection
Routes of administration	Intramuscular use

Dosage and administration details:

One dose (0,5 mL) contains 100 micrograms of messenger RNA (mRNA) (embedded in SM-102 lipid nanoparticles)

Preferred site of administration is the deltoid muscle of the upper arm.

2 dosages were given with an interval of 28 days (+7days).

Arm title	50-64 years of age, Spikevax (Moderna)
Arm description:	
50-64 years of age, Spikevax (Moderna)	
Arm type	Experimental

Only 1 late inclusions at Tc, no subjects truly started at starting point. Starting point set at 1 instead of 0 due to technical limitations.	
Arm type	Experimental
Investigational medicinal product name	Vaxzevria
Investigational medicinal product code	J07BN02
Other name	AstraZeneca
Pharmaceutical forms	Suspension for injection
Routes of administration	Intramuscular use

Dosage and administration details:

One dose (0,5 ml) contains Chimpanzee Adenovirus encoding the SARS-CoV-2 Spike glycoprotein (ChAdOx1-S), not less than $2,5 \times 10^8$ infectious units (Inf.U).

The product contains genetically modified organisms.

Preferable place of administration is the deltoid muscle of the upper arm.

2 dosages were given with an interval of 4 to 12 weeks

Notes:

[9] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: The trial started with the QIV +PCV series. COVID + booster vaccinations were later available that not all participants took. Each period is a separate part of the trial. Participants could then choose to enroll in the following period. Group allocation in the other periods was based on the corresponding vaccination, irrespective of former vaccinations. The number of participants starting another period is thus not equal to the number completing a previous period.

[10] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[11] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[12] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[13] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[14] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

Notes:

[15] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: The trial started with the QIV +PCV series. COVID + booster vaccinations were later available that not all participants took. Each period is a separate part of the trial. Participants could then choose to enroll in the following period. Group allocation in the other periods was based on the corresponding vaccination, irrespective of former vaccinations. The number of participants starting another period is thus not equal to the number completing a previous period.

[16] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[17] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[18] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

[19] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: It is correct that it seems that the number of subjects in the milestones are inconsistent with the total number of subjects in the arm. Because not all participants were included in all of the timepoints (milestones), due to missing data/blood samples for some timepoints.

Period 4

Period 4 title	COVID vaccination, second booster
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	50-64 years of age, booster 2, Comirnaty (Pfizer/BioNTech)

Arm description:

50-64 years of age, booster 2, Comirnaty (Pfizer/BioNTech)

Arm type	Experimental
Investigational medicinal product name	Comirnaty
Investigational medicinal product code	
Other name	COVID-19 mRNA Vaccine, Pfizer-BioNTech COVID-19 vaccine
Pharmaceutical forms	Dispersion for injection
Routes of administration	Intramuscular use

Dosage and administration details:

The vaccine is in a multidose vial and must be diluted before use.

One dose (0,3mL) contains 30 micrograms of tozinameran, a COVID-19 mRNA Vaccine (embedded in lipid nanoparticles).

Arm title	65+ years of age, booster 2, Comirnaty (Pfizer/BioNTech)
------------------	--

Arm description:

65+ years of age, booster 2, Comirnaty (Pfizer/BioNTech)

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Comirnaty
Investigational medicinal product code	
Other name	COVID-19 mRNA Vaccine, Pfizer-BioNTech COVID-19 vaccine
Pharmaceutical forms	Dispersion for injection
Routes of administration	Intramuscular use

Dosage and administration details:

The vaccine is in a multidose vial and must be diluted before use.

One dose (0,3mL) contains 30 micrograms of tozinameran, a COVID-19 mRNA Vaccine (embedded in lipid nanoparticles).

Arm title	50-64 years of age, booster 2, Spikevax (Moderna)
------------------	---

Arm description:

50-64 years of age, booster 2, Spikevax (Moderna)

Arm type	Experimental
Investigational medicinal product name	Spikevax
Investigational medicinal product code	
Other name	COVID-19 mRNA vaccine, Moderna
Pharmaceutical forms	Dispersion for injection
Routes of administration	Intramuscular use

Dosage and administration details:

One dose (0,25 mL) contains 50 micrograms of messenger RNA (mRNA) (embedded in SM-102 lipid nanoparticles)

Preferred site of administration is the deltoid muscle of the upper arm.

Arm title	65+ years of age, booster 2, Spikevax (Moderna)
------------------	---

Arm description:

65+ years of age, booster 2, Spikevax (Moderna)

Subject analysis set description:

Subset of participants (65+ years of age) who received a QIV vaccination in this study. Participants included in this serology analysis selection for the 6-months post QIV vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - Pre PCV-13 timepoint - 25-49 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (25-49 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the pre-vaccination timepoint are based on availability of per-protocol measurements at pre-vaccination and 28-days post PCV-13 vaccination timepoints.

Subject analysis set title	PCV-13 serology - Pre PCV-13 timepoint - 50-64 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the pre-vaccination timepoint are based on availability of per-protocol measurements at pre-vaccination and 28-days post PCV-13 vaccination timepoints.

Subject analysis set title	PCV-13 serology - Pre PCV-13 timepoint - 65+ y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the pre-vaccination timepoint are based on availability of per-protocol measurements at pre-vaccination and 28-days post PCV-13 vaccination timepoints.

Subject analysis set title	PCV-13 serology - 7-days post PCV-13 timepoint - 25-49 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (25-49 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 7-days post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 7-days post PCV-13 timepoint - 50-64 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 7-days post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 7-days post PCV-13 timepoint - 65+ y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 7-days post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 28-days post PCV-13 timepoint - 25-49 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (25-49 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 28-days post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at pre-vaccination and 28-days post PCV-13 vaccination timepoints.

Subject analysis set title	PCV-13 serology - 28-days post PCV-13 timepoint - 50-64 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 28-days post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at pre-vaccination and 28-days post PCV-13 vaccination timepoints.

Subject analysis set title	PCV-13 serology - 28-days post PCV-13 timepoint - 65+ y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 28-days post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at pre-vaccination and 28-days post PCV-13 vaccination timepoints.

Subject analysis set title	PCV-13 serology - 6-months post PCV-13 timepoint - 25-49 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (25-49 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 6-months post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 6-months post PCV-13 timepoint - 50-64 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 6-months post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 6-months post PCV-13 timepoint - 65+ y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 6-months post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 12-months post PCV-13 timepoint - 25-49 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (25-49 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 12-months post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 12-months post PCV-13 timepoint - 50-64 y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 12-months post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	PCV-13 serology - 12-months post PCV-13 timepoint - 65+ y/o
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a PCV-13 vaccination in this study. Participants included in this serology analysis selection for the 12-months post PCV-13 vaccination timepoint are based on availability of per-protocol measurements at this timepoint.

Subject analysis set title	QIV ELISpot - Pre QIV timepoint - 25-49y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (25-49 years of age) who received a QIV vaccination in this study. Participants included in this ELISpot analysis selection for the pre-QIV vaccination timepoint only if all measurements are available for this timepoint.

Subject analysis set title	QIV ELISpot - Pre QIV timepoint - 50-64y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (50-64 years of age) who received a QIV vaccination in this study. Participants included in this ELISpot analysis selection for the pre-QIV vaccination timepoint only if all measurements are available for this timepoint.

Subject analysis set title	QIV ELISpot - Pre QIV timepoint - 65+
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (65+ years of age) who received a QIV vaccination in this study. Participants included in this ELISpot analysis selection for the pre-QIV vaccination timepoint only if all measurements are available for this timepoint.

Subject analysis set title	QIV ELISpot - 7-days post QIV timepoint - 25-49y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (25-49 years of age) who received a QIV vaccination in this study. Participants included in this ELISpot analysis selection for the 7-days post QIV vaccination timepoint only if all measurements are available for this timepoint.

Subject analysis set title	QIV ELISpot - 7-days post QIV timepoint - 50-64y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (50-64 years of age) who received a QIV vaccination in this study. Participants included in this ELISpot analysis selection for the 7-days post QIV vaccination timepoint only if all measurements are available for this timepoint.

Subset of participants (65+ years of age) who received a PCV-13 vaccination in this study. Participants included in this ELISpot analysis selection for the 6-months post PCV-13 vaccination timepoint only if all measurements are available for this timepoint.	
Subject analysis set title	FACS analysis - younger adults
Subject analysis set type	Sub-group analysis
Subject analysis set description:	
Subset of participant 25-45 years of age included in analysis requiring FACS measurement at the timepoint 28-days post primary mRNA vaccination series. Due to participant selection and comparison with other cohorts, the age groups for this analysis differs from the general VITAL age groups.	
Subject analysis set title	FACS analysis - older adults
Subject analysis set type	Sub-group analysis
Subject analysis set description:	
Subset of participant 60+ years of age included in analysis requiring FACS measurement at the timepoint 28-days post primary mRNA vaccination series. Due to participant selection and comparison with other cohorts, the age groups for this analysis differs from the general VITAL age groups.	
Subject analysis set title	SARS-CoV-2 T-cell ELISpot - Pre vaccination timepoint - 25-49y
Subject analysis set type	Sub-group analysis
Subject analysis set description:	
Subset of participants (25-49 years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the pre-vaccination timepoint for T-cell ELISpot analysis.	
Subject analysis set title	SARS-CoV-2 T-cell ELISpot - Pre vaccination timepoint - 50-64y
Subject analysis set type	Sub-group analysis
Subject analysis set description:	
Subset of participants (50-64 years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the pre-vaccination timepoint for T-cell ELISpot analysis.	
Subject analysis set title	SARS-CoV-2 T-cell ELISpot - Pre vaccination timepoint - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description:	
Subset of participants (65+ years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the pre-vaccination timepoint for T-cell ELISpot analysis.	
Subject analysis set title	SARS-CoV-2 T-cell ELISpot - 28-days post vaccination - 25-49y
Subject analysis set type	Sub-group analysis
Subject analysis set description:	
Subset of participants (25-49 years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the timepoint 28-days post 2nd vaccination of primary series for T-cell ELISpot	

analysis.

Subject analysis set title	SARS-CoV-2 T-cell ELISpot - 28-days post vaccination - 50-64y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (50-64 years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the timepoint 28-days post 2nd vaccination of primary series for T-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 T-cell ELISpot - 28-days post vaccination - 65+
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (65+ years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the timepoint 28-days post 2nd vaccination of primary series for T-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - 28-days post vaccination - 25-49y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (25-49 years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the timepoint 28-days post 2nd vaccination of primary series for B-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - 28-days post vaccination - 50-64y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (50-64 years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the timepoint 28-days post 2nd vaccination of primary series for B-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - 28-days post vaccination - 65+
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (65+ years of age) who received a SARS-CoV-2 mRNA primary vaccination series, included at the timepoint 28-days post 2nd vaccination of primary series for B-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - Pre booster - 25-49y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (25-49 years of age) who received a first SARS-CoV-2 mRNA booster, included at the pre-booster vaccination timepoint for B-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - Pre booster - 50-64y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (50-64 years of age) who received a first SARS-CoV-2 mRNA booster, included at the pre-booster vaccination timepoint for B-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - Pre booster - 65+
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (65+ years of age) who received a first SARS-CoV-2 mRNA booster, included at the pre-booster vaccination timepoint for B-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - 28-days post booster - 25-49y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (25-49 years of age) who received a first SARS-CoV-2 mRNA booster, included at the 28-days post booster vaccination timepoint for B-cell ELISpot analysis.

Subject analysis set title	SARS-CoV-2 B-cell ELISpot - 28-days post booster - 50-64y
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (50-64 years of age) who received a first SARS-CoV-2 mRNA booster, included at the 28-days post booster vaccination timepoint for B-cell ELISpot analysis.	
Subject analysis set title	SARS-CoV-2 B-cell ELISpot - 28-days post booster - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (65+ years of age) who received a first SARS-CoV-2 mRNA booster, included at the 28-days post booster vaccination timepoint for B-cell ELISpot analysis.	
Subject analysis set title	mucosal antibody analysis - Pre 1st booster - 25-49y
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (25-49 years of age) who received a first SARS-CoV-2 mRNA booster, included at the pre-booster vaccination timepoint for mucosal antibody analysis.	
Subject analysis set title	mucosal antibody analysis - Pre 1st booster - 50-64y
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (50-64 years of age) who received a first SARS-CoV-2 mRNA booster, included at the pre-booster vaccination timepoint for mucosal antibody analysis.	
Subject analysis set title	mucosal antibody analysis - Pre 1st booster - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (65+ years of age) who received a first SARS-CoV-2 mRNA booster, included at the pre-booster vaccination timepoint for mucosal antibody analysis.	
Subject analysis set title	mucosal antibody analysis - 28-days post 1st booster - 25-49y
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (25-49 years of age) who received a first SARS-CoV-2 mRNA booster, included at the timepoint 28-days post first booster for mucosal antibody analysis.	
Subject analysis set title	mucosal antibody analysis - 28-days post 1st booster - 50-64y
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (50-64 years of age) who received a first SARS-CoV-2 mRNA booster, included at the timepoint 28-days post first booster for mucosal antibody analysis.	
Subject analysis set title	mucosal antibody analysis - 28-days post 1st booster - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (65+ years of age) who received a first SARS-CoV-2 mRNA booster, included at the timepoint 28-days post first booster for mucosal antibody analysis.	
Subject analysis set title	Spikevax serology - Pre primary series - 25-49y
Subject analysis set type	Per protocol
Subject analysis set description: Subset of participants (25-49 years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the pre-vaccination timepoint.	
Subject analysis set title	Spikevax serology - 28-days post 1st primary vaccine - 25-49y
Subject analysis set type	Per protocol
Subject analysis set description: Subset of participants (25-49 years of age) who received a Spikevax (Moderna) mRNA primary series	

(consisting of 2 vaccinations), included at the 28-days post 1st vaccination timepoint.

Subject analysis set title	Spikevax serology - 28-days post 2nd primary vaccine - 25-49y
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (25-49 years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 28-days post 2nd vaccination timepoint.

Subject analysis set title	Spikevax serology - 6-months post primary series - 25-49y
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (25-49 years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 6-months post primary vaccination series timepoint.

Subject analysis set title	Spikevax serology - Pre primary series - 50-64y
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the pre-vaccination timepoint.

Subject analysis set title	Spikevax serology - 28-days post 1st primary vaccine - 50-64y
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 28-days post 1st vaccination timepoint.

Subject analysis set title	Spikevax serology - 28-days post 2nd primary vaccine - 50-64y
Subject analysis set type	Sub-group analysis

Subject analysis set description:

Subset of participants (50-64 years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 28-days post 2nd vaccination timepoint.

Subject analysis set title	Spikevax serology - 6-months post primary series - 50-64y
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (50-64 years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 6-months post primary vaccination series timepoint.

Subject analysis set title	Spikevax serology - Pre primary series - 65+
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the pre-vaccination timepoint.

Subject analysis set title	Spikevax serology - 28-days post 1st primary vaccine - 65+
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 28-days post 1st vaccination timepoint.

Subject analysis set title	Spikevax serology - 28-days post 2nd primary vaccine - 65+
Subject analysis set type	Per protocol

Subject analysis set description:

Subset of participants (65+ years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 28-days post 2nd vaccination timepoint.

Subject analysis set title	Spikevax serology - 6-months post primary series - 65+
----------------------------	--

Subject analysis set type	Per protocol
Subject analysis set description: Subset of participants (65+ years of age) who received a Spikevax (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 6-months post primary vaccination series timepoint.	
Subject analysis set title	Comirnaty serology - Pre primary series - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (65+ years of age) who received a Comirnaty (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the pre-vaccination timepoint.	
Subject analysis set title	Comirnaty serology - 28-days post 1st primary vaccine - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (65+ years of age) who received a Comirnaty (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 28-days post 1st vaccination timepoint.	
Subject analysis set title	Comirnaty serology - 28-days post 2nd primary vaccine - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (65+ years of age) who received a Comirnaty (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 28-days post 2nd vaccination timepoint.	
Subject analysis set title	Comirnaty serology - 6-months post primary series - 65+
Subject analysis set type	Sub-group analysis
Subject analysis set description: Subset of participants (65+ years of age) who received a Comirnaty (Moderna) mRNA primary series (consisting of 2 vaccinations), included at the 6-months post primary vaccination series timepoint.	

Primary: Pneumococcal serotype-specific serum IgG antibody concentrations (GMCs) pre and one-month post PCV13 vaccination.

End point title	Pneumococcal serotype-specific serum IgG antibody concentrations (GMCs) pre and one-month post PCV13 vaccination.
End point description: Pneumococcal serotype- specific serum IgG antibody concentrations pre-vaccination and one-month post PCV13 vaccination measured by bead-based multiplex immune assay. Full analysis is published in Van der Heiden et al., Nat Commun 2024, https://doi.org/10.1038/s41467-024-50760-9

Adverse events

Adverse events information^[1]

Timeframe for reporting adverse events:

Any adverse event spontaneously reported by the subject occurring within 28 days after vaccination, or within one week after swab collection or blood sampling.

Assessment type	Non-systematic
-----------------	----------------

Dictionary used

Dictionary name	MedDRA
Dictionary version	27.1

Reporting groups

Reporting group title	QIV, PCV-13 and SARS-CoV-2 immunization
Reporting group description: -	

Notes:

[1] - There are no non-serious adverse events recorded for these results. It is expected that there will be at least one non-serious adverse event reported.

Justification: It is correct that no non-serious adverse events are recorded. As described in the protocol, only adverse events that were reported spontaneously by the subject or observed by the investigator or study staff were recorded. Adverse events were not actively recorded or requested. As a result, no adverse event occurred in more than 5% of participants. Therefore, reporting these data would not provide an accurate or representative overview of the adverse events in this study.

Serious adverse events	QIV, PCV-13 and SARS-CoV-2 immunization		
Total subjects affected by serious adverse events			
subjects affected / exposed	9 / 326 (2.76%)		
number of deaths (all causes)	10		
number of deaths resulting from adverse events	1		
Neoplasms benign, malignant and unspecified (incl cysts and polyps)			
Lymphoma			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Injury, poisoning and procedural complications			
Periprosthetic fracture			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Post procedural haemorrhage			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		

Cardiac disorders			
Atrial fibrillation			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Myocardial infarction			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 1		
Nervous system disorders			
Balance disorder			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Pregnancy, puerperium and perinatal conditions			
Miscarriage			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Respiratory, thoracic and mediastinal disorders			
Dyspnoea			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Infections and infestations			
Pneumonia			
subjects affected / exposed	1 / 326 (0.31%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		

Frequency threshold for reporting non-serious adverse events: 5 %

Non-serious adverse events	QIV, PCV-13 and SARS-CoV-2 immunization		
Total subjects affected by non-serious adverse events subjects affected / exposed	0 / 326 (0.00%)		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
24 June 2020	<p>This amendment concerns:</p> <p>a) Additional small blood sample collection by finger stick for all participants to assess Influenza- specific antibodies. Due to the COVID-19 pandemic, the T5 visits were postponed. Because it was unclear if the T5 visits could be resumed within the 5-8 month follow-up window, it was proposed to collect a small additional blood sample by self-sampling. Hereby, long term follow-up evaluation of influenza specific antibodies 5-9 months after influenza vaccination was still allowed.</p> <p>b) Determine the impact of potential COVID-19 infections on baseline and vaccine induced immune responses in the participants: All participants in the study have been asked to report any influenza like illness symptoms during the influenza season, they will be asked to continue reporting these symptoms during the whole study period to also record COVID related symptoms. In addition, SARS-CoV-2 serology will be included in the analyses.</p> <p>c) Extend the period of Influenza Like Infection (ILI) monitoring due to the COVID-19 pandemic.</p> <p>d) Changes in ILI monitoring form. With the adaptations also COVID-19 specific symptoms were monitored.</p> <p>e) Additional questionnaire "Zorgnetwerk en COVID-19". This questionnaire will assess changes in healthcare networks due to the COVID19 pandemic and shed light on the impact of the pandemic on healthcare networks and the implications thereof for the participant</p> <p>f) Change in pneumococcal vaccination letter for elderly and their general practitioner. Because of the COVID19 pandemic the State Secretary of Health, Welfare and Sports decided to change the age groups eligible for PPV23 vaccination based on a recent report of the "gezondheidsraad".</p> <p>g) QIV 2020-2021 vaccination at T8 visit</p>
14 January 2021	<p>The amendment concerns a change of no longer analyzing the long term effect of PCV13 vaccination on pneumococcal specific cellular immunity and carriage at 12 months post vaccination. Pneumococcal antibody responses will still be evaluated at 12 months post vaccination. This post vaccination analysis can be done in a small blood volume so the T10 (home) visit will be replaced by a fingerstick blood collection performed by the participants themselves. This also has the advantage that there will be one contact moment less between the study participants and members of the study teams in case of the COVID-19 pandemic.</p>
22 February 2021	<p>An addition of a evaluation of the immune response to COVID-19 vaccination. Humoral and cellular responses in older adults will be compared with the responses elicited in the other adult age groups. Moreover, the immune response to the COVID-19 vaccine will be compared to responses to influenza and pneumococcal vaccinations, that have been analyzed as part of the study protocol, within the different age groups. The COVID-19 vaccination schedule for the the vaccines used in this study, consists of two vaccine doses to be given with a 4 week interval. A total of 5 additional evaluation timepoints, four visits and one self sampling timepoints, will be added to the protocol. At visit Ta and Tb the COVID-19 vaccination will be given. For evaluation of the COVID-19 vaccine induced immune response samples will be collected at 1st and 2nd vaccination visit, during a visit 1 month later as well as 6 and 12 months post second COVID-19 vaccination. At timepoint 6 months after vaccination blood samples will be collected by fingerprick self sampling.</p>

03 November 2021	Evaluate the immune response induced by a COVID-19 booster vaccination as a measurement for its effectiveness of the Dutch national vaccination program. Determine the SARS-CoV-2 booster vaccination induced humoral and cellular immune response and compare the responses between elderly and younger age groups of a well characterized cohort. This will result in extra timepoints; Pre booster (B0), at 28 days (-7/+14 days; B1), 6 months (+/- 4 weeks; B2) and 12 months (+/- 4 weeks; B3) post booster vaccination. Depending on the timing of the SARS-CoV-2 booster vaccination timepoints after the second vaccination can be skipped. A subgroup of participants will be asked to participate in the analysis of the cellular immune response.
09 March 2022	Determine the immune response induced by additional COVID-19 booster vaccinations as part of the evaluation of the effectiveness of the Dutch national COVID vaccination program, similar to the scheme as originally planned and compare the 3 month post 1st booster immune response between the different age groups of the Vital cohort. This booster vaccination is followed in persons above 70+ years of age. this will result in extra timepoints for blood sampling; pre booster, at 28 days (-7 till +14 days) post, 6 months (+/- 4 weeks) and 12 months (+/- 4 weeks) post booster vaccination.
24 August 2023	Determine the immune response induced by additional COVID-19 booster vaccination as part of the evaluation of the effectiveness of the Dutch national COVID vaccination program. Of the healthy population only persons of 60 years and older will be eligible for the autumn 2023 COVID-19 vaccination round. Therefore only participants from the Spaarne Hospital in this age group will be invited for participation in the autumn 2023 COVID-19 vaccine immune response follow-up extension of the study. This will result in extra timepoints; Pre booster (E0), at 28 days (-7/+14 days; E1) and 12 months (+/- 4 weeks; E3) post booster vaccination. The study for the middle-aged and adult subjects will be ended. These groups will not be followed after a booster SARS-CoV-2 vaccination obtained in autumn 2023. To complete the protocol, information about the booster in autumn 2022 was included. The follow up of this booster was covered by amendment 4 and notification from November 2022
06 October 2023	Correct the age of participants who were eligible for follow-up after the second booster in February 2022, mentioned in amendment 5. Originally individuals of 70 years and older were eligible for the additional booster dose to be given in the spring of 2022. Based on this information protocol amendment 5 added follow-up of the additional booster dose in Vital-corona participants of 70 years and older to the study. However, after submission of amendment 5, the minister decided that persons -70 years of age were also eligible for a second booster dose. Therefore these participants older than 60 years of age were invited for participation in the additional follow-up of this study after the second booster vaccination.
21 August 2024	Including the collection of nasal lining fluid at timepoint 12 months after booster 2023. Adding the collection of an MLF sample at 12 months post 2023 booster vaccination will give an indication of the duration of the mucosal antibody response.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
------	--------------	--------------

12 March 2020	Due to the COVID-19 pandemic the visits were temporarily stopped. The most important reason was the fragility of the participants 70 years and older. Furthermore, the participants who were working at the UMCU/RIVM and who had visits planned at the locations, were asked to work from home. That's why these visits also couldn't continue. Another reason was, the tasks planned at the visits couldn't be executed at 1.5m distance, which was the regulation at that time.	13 July 2020
